Optimal Dynamic Selection Under Costly Evaluation: Evidence from Graduate Admissions

Jeremy Rosen

Georgetown University

October 15, 2026

Motivation

- **Economic Problem:** Selecting best options under costly evaluation
  - Determining each option's true quality costs decision-maker time and effort
  - Low-cost screening of all options $\Rightarrow$ high-cost evaluation of surviving options
  - **Examples:** Admissions and hiring, clinical trials, matching platforms
- **Why Graduate Admissions:** Benefits graduate programs and future applicants
  - Graduate programs invest time and money into students' development
  - Shrinking PhD cohorts (Angrist et al. 2026) $\Rightarrow$ each admission matters more
  - Programs may be undervaluing applicants with certain characteristics
  - Future such applicants may receive currently-withheld opportunities

Research Questions

1. Are admissions committees optimizing, or are they making mistakes?
   - Goal is to accept applicants with highest success probabilities who will matriculate
   - Per literature, measure success with program completion and job placement ranking
   - Predictors of acceptance only (success only) may be overweighted (underweighted)
2. If they are making mistakes, how can they make better admissions decisions?
   - In turn, by changing decision rules, how much better of a cohort can they admit?
   - Look for applicants who were rejected, would have matriculated, and succeeded

★ Methods apply to undergraduate/professional admissions, hiring, and other settings

Methods and Results

- Build structural models of admissions committee's decision problem that support:
  - Statistical tests of whether committee's decision rule aligns with desired objective
  - Counterfactual simulations quantifying gain from deviating to model's decision rule
- Estimate model parameters with admissions data from a major research university
  - On most dimensions, estimated success probabilities align with committee's decisions
  - Reweighting some applicant characteristics could have increased admitted cohort's average success probability by 4 percentage points without reading more files

Contribution to Literature

- **Graduate Admissions:** Regress acceptance and success on applicant characteristics
  - Krueger & Wu (2000); Athey et al. (2007); Stock et al. (2006–2015); Bai et al. (2022)
- **Optimal Dynamic Selection Under Costly Evaluation:**
  - **Sequential Search:** McCall (1970); Mortensen (1970); Weitzman (1979)
  - **Rational Inattention:** Sims (2003); Matějka & McKay (2015); Caplin & Dean (2015)
  - **Optimality:** Cho & Rust (2010); Hoffman et al. (2018); Kleinberg et al. (2018); Rambachan (2024); Anderson, Rosen, Rust & Wong (2025)
  - **Multistage Selection:** Baron et al. (2026); Lessem & Miller (2026)

★ **This Paper:** Builds and estimates dynamic selection models of admissions, which relate acceptance effects to success effects through the committee's problem

Synthetic Data Protocol (IRB-Approved)

1. **Administrative office receives data from university departments**
   - Algorithmically extracts variables from textual files, such as recommendation letters
2. **Synthetic data (Patki et al. 2016) used for model development**
   - Estimate joint distribution of variables, and simulate synthetic dataset from it
   - Rows do not correspond to real subjects, preventing identity disclosure
   - Cells with < 5 comparable observations binned to prevent attribute disclosure
3. **Administrative office executes final estimation code on actual data**
   - Only summary statistics and parameter estimates are returned to researcher

★ **Contribution:** Privacy-protecting framework for researchers studying sensitive data

Synthetic Data Example

Outline

1. Regression Analysis
2. Structural Models
3. Structural Estimation
4. Optimality and Deviation Gains

Data Description

- **Sample:** Applicants to research university's economics PhD program from 2015–2019
- **Outcomes:** Measures of admission and success
  - **Admission:** Read File $\Rightarrow$ Accept $\Rightarrow$ Matriculate $\Rightarrow$ Success
  - **Success:** Completion and placement category/quality for **all** applicants, with academia-equivalent rankings for non-academic placements (Krueger & Wu 2000)
- **Covariates:** Objective vs. subjective variables
  - **Objective:** Demographics and performance measures, such as GRE scores
  - **Subjective:** Textual processing of recommendation letters, statements of purpose, CVs, and supplemental forms using dictionaries to construct variables

⏩ Variables ⏩ Inference vs. Prediction ⏩ Sample Selection

Regression Results

- **Method:** Logistic regressions for acceptance, matriculation, and success
  - **Success:** *Top 100 Placement* $= 1$ for 20% of applicants vs. 34% of matriculants
- **Results:** Different independent variables best predict each dependent variable
  - **Accept:** *Committee Score* is best predictor. Other predictors: demographics, *GRE Quantitative Percentile*, *Work Experience*, *CV Coding* (negative)
  - **Matriculate:** Predictors of acceptance often negatively predict matriculation. Best predictor of matriculation is *Open House* attendance
  - **Success:** *PhD Program Rank* is best predictor. Rank held equal, other predictors: *Age*, *TOEFL/IELTS*, *Work Experience*, *Essay Positive Terms (%)*

Insufficiency of Comparing AMEs | Diversity Objective | Regressions vs. Model

- Admissions literature regresses acceptance and success on variables in applications, and qualitatively compares the effects
- While such comparisons are of interest, they are insufficient to assess optimality
- Need model of admissions to relate acceptance effects to success effects

Outline

1 Regression Analysis

2 Structural Models

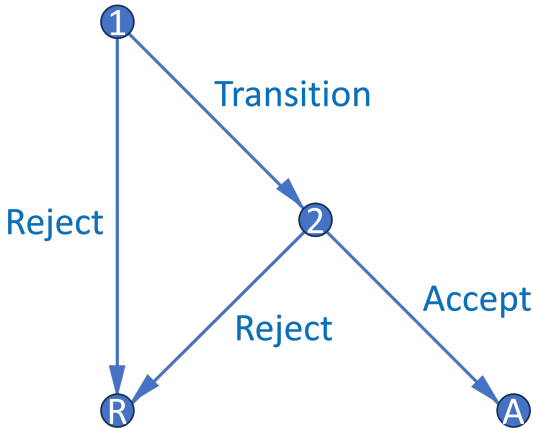

3 Structural Estimation

4 Optimality and Deviation Gains

Why Structural Models?

- **Reason 1:** Test whether committee's decision rule aligns with desired objective
  - Maximize admitted cohort's quality, considering matriculation probabilities
- **Reason 2:** Find counterfactual decision rule in which committee optimizes
  - Quantify gains from deviating from actual to counterfactual decision rule

Dynamics

- **Round 1:** See only objective variables. Transition to Round 2 or reject
- **Round 2:** See survivors' objective and subjective variables. Accept or reject
- Assume for now number of applicants transitioned and accepted is fixed
- Matriculation model will account for success and matriculation probabilities

Models of Admissions

Portfolio Choice Problem

For each applicant n, choose $d_{1,n} \in \{\text{Transition}, \text{Reject}\}$ and $d_{2,n} \in \{\text{Accept}, \text{Reject}\}$:

Round 2:

$$\max_{(d_{2,1},\ldots,d_{2,N_T}) \in \{A,R\}^{N_T}} \sum_{n=1}^{N_T} \underbrace{P(y_n = S | x_n, z_n)}_{\text{Success probability}} \underbrace{\mathbb{1}(d_{2,n} = A)}_{\text{Acceptance}}, \text{ where: } \sum_{n=1}^{N_T} \underbrace{\mathbb{1}(d_{2,n} = A)}_{\text{Acceptance}} \leq N_A,$$

Round 1:

$$\max_{(d_{1,1},\ldots,d_{1,N}) \in \{T,R\}^{N}} \sum_{n=1}^{N} \underbrace{EV_{2,n}(x_n)}_{\mathbb{E}[\text{Round 2 Value}]} \underbrace{\mathbb{1}(d_{1,n} = T)}_{\text{Transition}}, \text{ where: } \sum_{n=1}^{N} \underbrace{\mathbb{1}(d_{1,n} = T)}_{\text{Transition}} \leq N_T,$$

where x = objective variables, z = subjective variables, $y \in \{\text{Success}, \text{Failure}\}$, N = number of applicants, (N_T, N_A) = max number of files read/acceptances

Portfolio Choice to Cutoff Rule

- How to estimate model, given so many possible combinations of applicants?
- Assuming no complementarities, portfolio choice problem has cutoff rule solution
- **Round 2:** Accept transitioned applicant if success probability exceeds Round 2 cutoff

$$d^*_{2,n} = \begin{cases} A & \text{if } P(y_n = S|x_n, z_n) > \text{Cutoff}_2 \\ \{A, R\} & \text{if } P(y_n = S|x_n, z_n) = \text{Cutoff}_2 \\ R & \text{if } P(y_n = S|x_n, z_n) < \text{Cutoff}_2 \end{cases}$$

- **Round 1:** Transition applicant if Round 2 expected value exceeds Round 1 cutoff

$$d^*_{1,n} = \begin{cases} T & \text{if } EV_{2,n}(x_n) > \text{Cutoff}_1 \\ \{T, R\} & \text{if } EV_{2,n}(x_n) = \text{Cutoff}_1 \\ R & \text{if } EV_{2,n}(x_n) < \text{Cutoff}_1 \end{cases}$$

Lagrangians

Cutoff Rule Model

- **Goal:** Use choices and outcomes data to estimate success probabilities, while respecting constraint on number of files committee can read
- **Legend:** Estimated model objects vs. Choices and outcomes data

Cutoff Rule Model, Round 2

$$v_2(x, z, t, \overline{k}, \epsilon_2) = \max_{d_2 \in \{A,R\}} u_2(x, z, t, \overline{k}, d_2) + \epsilon_2(d_2), \text{ where:}$$

$$u_2(x, z, t, \overline{k}, d_2) = \underbrace{P(y = S|x, z, t, \overline{k})\mathbb{1}(d_2 = A)}_{\text{If accept, get } P(\text{Success})} + \underbrace{P(y_2^* = S|t)\mathbb{1}(d_2 = R)}_{\text{If reject, get Round 2 Cutoff}}$$

- **States:** (x, z) = objective and subjective variables, t = year, $\overline{k}$ = fixed program rank, (ϵ_1, ϵ_2) = Type 1 extreme value preference shocks with scale parameter σ
- **Choices:** $d_1 \in \{\text{Transition}, \text{Reject}\}$, $d_2 \in \{\text{Accept}, \text{Reject}\}$
- **Outcomes:** $y \in \{\text{Success}, \text{Failure}\}$, (y_1^*, y_2^*) = marginal outcomes

Cutoff Rule Model, Round 1

$$v_1(x, t, \overline{k}, \epsilon_1) = \max_{d_1 \in \{T, R\}} u_1(x, t, \overline{k}, d_1) + \epsilon_1(d_1), \text{ where:}$$

$$u_1(x, t, \overline{k}, d_1) = \underbrace{\mathbb{E}[v_2(x, z, t, \overline{k}, \epsilon_2)|x, t, \overline{k}]\mathbb{1}(d_1 = T)}_{\text{If transition, get } \mathbb{E}\text{[Round 2 Value]}} + \underbrace{L(y_1^* = S|t)\mathbb{1}(d_1 = R)}_{\text{If reject, get Round 1 Cutoff}}$$

- **States:** (x, z) = objective and subjective variables, t = year, $\overline{k}$ = fixed program rank, (ϵ_1, ϵ_2) = Type 1 extreme value preference shocks with scale parameter σ
- **Choices:** $d_1 \in \{\text{Transition}, \text{Reject}\}$, $d_2 \in \{\text{Accept}, \text{Reject}\}$
- **Outcomes:** $y \in \{\text{Success}, \text{Failure}\}$, (y_1^*, y_2^*) = marginal outcomes

Conditional Choice Probabilities

- **Round 2:** Higher payoff from accepting $\Rightarrow$ higher probability of accepting

$$P(d_2 = A|x, z, t, \overline{k}) = \frac{\exp(u_2(\cdot, A)/\sigma)}{\exp(u_2(\cdot, A)/\sigma) + \exp(u_2(\cdot, R)/\sigma)}$$

- **Round 1:** Higher payoff from reading file $\Rightarrow$ higher probability of reading file

$$P(d_1 = T|x, t, \overline{k}) = \frac{\exp(u_1(\cdot, T)/\sigma)}{\exp(u_1(\cdot, T)/\sigma) + \exp(u_1(\cdot, R)/\sigma)}$$

Dynamic Parameterization | Static Model | Maximum Likelihood Estimation

Portfolio Choice with Matriculation

Round 2:

$$\max_{(d_{2,1},\ldots,d_{2,N_T})\in\{A,R\}^{N_T}} \sum_{n=1}^{N_T} \underbrace{P(y_n = S|x_n, z_n)}_{\text{Success probability}} \underbrace{P(m_n = M|x_n, z_n)}_{\text{Matriculation probability}} \underbrace{\mathbb{1}(d_{2,n} = A)}_{\text{Acceptance}},$$

$$\text{where: } \sum_{n=1}^{N_T} \underbrace{P(m_n = M|x_n, z_n)}_{\text{Matriculation probability}} \underbrace{\mathbb{1}(d_{2,n} = A)}_{\text{Acceptance}} \leq N_M,$$

Round 1:

$$\max_{(d_{1,1},\ldots,d_{1,N})\in\{T,R\}^{N}} \sum_{n=1}^{N} \underbrace{EV_{2,n}(x_n)}_{\mathbb{E}[\text{Round 2 Value}]} \underbrace{\mathbb{1}(d_{1,n} = T)}_{\text{Transition}}, \text{ where: } \sum_{n=1}^{N} \underbrace{\mathbb{1}(d_{1,n} = T)}_{\text{Transition}} \leq N_T,$$

where (x, z) = variables, $y \in \{\text{Success}, \text{Failure}\}$, $m \in \{\text{Matriculate}, \text{Decline}\}$, N = number of applicants, (N_T, N_M) = max number of files read/matriculants

Cutoff Rule with Matriculation

$$\max_{(d_{2,1},\ldots,d_{2,N_T})\in\{A,R\}^{N_T}} \sum_{n=1}^{N_T} \underbrace{P(y_n = S|x_n, z_n)}_{\text{Success probability}} \underbrace{P(m_n = M|x_n, z_n)}_{\text{Matriculation probability}} \underbrace{\mathbb{1}(d_{2,n} = A)}_{\text{Acceptance}},$$

$$\text{where: } \sum_{n=1}^{N_T} \underbrace{P(m_n = M|x_n, z_n)}_{\text{Matriculation probability}} \underbrace{\mathbb{1}(d_{2,n} = A)}_{\text{Acceptance}} \leq N_M,$$

Theorem 1

For large N_T, Round 2 problem has a cutoff rule solution on **success** *probabilities.*

- Likely matriculants more valuable, but also more expensive ⇒ effects cancel
- Matriculation probabilities matter in Round 1, especially for low-ranked programs

Lagrangians with Matriculation

Cutoff Rule with Matriculation, Round 2

$$v_2(x, z, t, \overline{k}, \epsilon_2) = \max_{d_2 \in \{A,R\}} u_2(x, z, t, \overline{k}, d_2) + \epsilon_2(d_2), \text{ where:}$$

$$u_2(x, z, t, \overline{k}, d_2) = \underbrace{P(y = S|x, z, t, \overline{k})\mathbb{1}(d_2 = A)}_{\text{If accept, get } P(\text{Success})} + \underbrace{P(y_2^* = S|t)\mathbb{1}(d_2 = R)}_{\text{If reject, get Round 2 Cutoff}}$$

- **States:** (x, z) = objective and subjective variables, t = year, $\overline{k}$ = fixed program rank, (ϵ_1, ϵ_2) = Type 1 extreme value preference shocks with scale parameter σ
- **Choices:** $d_1 \in \{\text{Transition}, \text{Reject}\}$, $d_2 \in \{\text{Accept}, \text{Reject}\}$
- **Outcomes:** $y \in \{\text{Success}, \text{Failure}\}$, $m \in \{\text{Matriculate}, \text{Decline}\}$, (y_1^*, y_2^*, m_1^*) = marginal outcomes

Cutoff Rule with Matriculation, Round 1

$$v_1(x, t, \overline{k}, \epsilon_1) = \max_{d_1 \in \{T,R\}} u_1(x, t, \overline{k}, d_1) + \epsilon_1(d_1), \text{ where:}$$

$$u_1(x, t, \overline{k}, d_1) = \underbrace{\mathbb{E}[v_2(x, z, t, \overline{k}, \epsilon_2)|x, t, \overline{k}]\mathbb{1}(d_1 = T)}_{\text{If transition, get } \mathbb{E}[\text{Round 2 Value}]} + \underbrace{L(y_1^* = S, m_1^* = M|t)\mathbb{1}(d_1 = R)}_{\text{If reject, get Round 1 Cutoff}}$$

- **States:** $(x, z) =$ objective and subjective variables, $t =$ year, $\overline{k} =$ fixed program rank, $(\epsilon_1, \epsilon_2) =$ Type 1 extreme value preference shocks with scale parameter σ
- **Choices:** $d_1 \in \{\text{Transition}, \text{Reject}\}$, $d_2 \in \{\text{Accept}, \text{Reject}\}$
- **Outcomes:** $y \in \{\text{Success}, \text{Failure}\}$, $m \in \{\text{Matriculate}, \text{Decline}\}$, $(y_1^*, y_2^*, m_1^*) =$ marginal outcomes

Importance of Matriculation

$$\lim_{\sigma \to 0} EV_2 = \mathbb{E}_{\widetilde{z}}[\max\{P(y = S|x, \widetilde{z}, t, \overline{k}) - P(y_2^* = S|t), 0\} P(m = M|x, \widetilde{z}, t)|x, t, \overline{k}]$$

- Matriculation matters when expected success probability $\gg$ Round 2 cutoff
- **Upshot:** Low-ranked programs must consider matriculation in Round 1

Outline

1 Regression Analysis

2 Structural Models

3 Structural Estimation

4 Optimality and Deviation Gains

Maximum Likelihood Estimation

$$\mathcal{L}_N^U(\theta) = \prod_{n=1}^{N} \underbrace{f\left(z_n | x_n, t_n; \theta_F\right)}_{\text{Density of } z|x,t} \underbrace{P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)}(1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)}}_{\text{Success probabilities}}$$

$$\prod_{n=1}^{N} \underbrace{P_{d_{1,n}}(\theta_T)^{\mathbb{1}(d_{1,n}=T)}\left(1 - P_{d_{1,n}}(\theta_T)\right)^{\mathbb{1}(d_{1,n}=R)}}_{\text{Round 1 conditional choice probabilities}} \prod_{n=1}^{N_T} \underbrace{P_{d_{2,n}}(\theta_A)^{\mathbb{1}(d_{2,n}=A)}(1 - P_{d_{2,n}}(\theta_A))^{\mathbb{1}(d_{2,n}=R)}}_{\text{Round 2 conditional choice probabilities}}$$

- In unrestricted likelihood $\mathcal{L}^U$, parameterize CCPs with logistic specifications
- In restricted likelihood $\mathcal{L}^R$, use model CCPs, which depend on structural parameters
- $\mathcal{L}^R$ aligns success probabilities implied by outcomes with those implied by CCPs

Conditional Choice Probabilities | Matriculation-Dynamic Likelihood | Empirical Considerations

Cutoff Probability Identification

- Identify each year's cutoffs by how selective committee is that year
  - Fewer acceptances and stronger applicants increase cutoff
  - More acceptances and weaker applicants decrease cutoffs
- While selectivity identifies cutoffs, sorting improves restricted likelihood

Theorem 2

Cutoff probability estimate is such that number of acceptances N_A equals expected N_A.

For any cutoff and N_A, likelihood is highest when committee accepts best N_A applicants.

Restricted Estimates

	Round 1 Cutoff	Round 2 Cutoff	Sigma
2015	0.3731	36.58%	
	(0.3067, 0.4539)	(29.81%, 43.92%)	
⋮	⋮	⋮	
2019	0.3887	38.14%	
	(0.3268, 0.4624)	(31.89%, 44.81%)	
Sigma			0.0020
			(0.0013)

- Round 1 cutoffs relative to EV_2. Round 2 cutoffs relative to success probabilities
- Cutoffs stable across years. $\hat{\sigma}$ small $\Rightarrow$ distorted restricted success probabilities

Dynamic Estimates | Static Estimates | Myopic Estimates

Restricted Estimates with Matriculation

	Round 1 Cutoff	Round 2 Cutoff	Sigma
2015	0.0071 (0.0026, 0.0194)	36.35% (29.47%, 43.84%)	
⋮	⋮	⋮	
2019	0.0095 (0.0035, 0.0255)	37.41% (31.04%, 44.26%)	
Sigma			0.0020** (0.0010)

- With matriculation, EV_2's functional form yields lower Round 1 cutoffs

⏩ Matriculation-Dynamic Estimates

Outline

1 Regression Analysis

2 Structural Models

3 Structural Estimation

4 Optimality and Deviation Gains

Deviation Gains

- Suppose committee adopted model's decision rule with $\sigma = 0$ and N_T unchanged
- Would average success probability of acceptance/matriculation set have increased?
  1. Select applicants with model, and determine its acceptance/matriculation set
  2. Compute average success probability of its acceptance/matriculation set
  3. Compare average success probability to that of set chosen by committee's rule
- Plug $\hat{\theta}_S^U$ into model because $\hat{\theta}_S^R$ may be distorted to rationalize suboptimal behavior

» Deviation Gains Procedure

Deviation Gains Test

- Is deviation gain significant? Do z test of $H_0\colon g(\theta^0_S) = 0$ vs. $H_1\colon g(\theta^0_S) > 0$
  1. Gain is approximately normal, so test statistic is standardized gain. **Or:**
  2. Compute average success probabilities across B perturbations $\tilde{\theta}^U_{S,b}$ of $\hat{\theta}^U_S$

Theorem 3

P-value is fraction of perturbations with model's $\overline{P(Success)}$ *less than committee's.*

- Model's set must be exogenously chosen, e.g. train and test on different data
  - If not, gain will be biased upward, and test will be biased toward rejection
  - In bigger dataset, such as hiring at large company, holdout set is feasible

Deviation Gains Correction

- Observed deviation gain is combination of true gain and "winner's curse"

$$g(\hat{\theta}_S^U) = \underbrace{\overline{P}_{\mathcal{A}^R(\hat{\theta}_S^U)}(\hat{\theta}_S^U)}_{\text{Model}} - \underbrace{\overline{P}_{\mathcal{A}^U}(\hat{\theta}_S^U)}_{\text{Committee}}$$

$$= \underbrace{\overline{P}_{\mathcal{A}^R(\hat{\theta}_S^U)}(\hat{\theta}_S^U) - \overline{P}_{\mathcal{A}^R(\theta_S^0)}(\hat{\theta}_S^U)}_{\text{Winner's curse}} + \underbrace{\overline{P}_{\mathcal{A}^R(\theta_S^0)}(\hat{\theta}_S^U) - \overline{P}_{\mathcal{A}^U}(\hat{\theta}_S^U)}_{\text{True gain at } \hat{\theta}_S^U}$$

- Subtract estimate of winner's curse from observed deviation gain

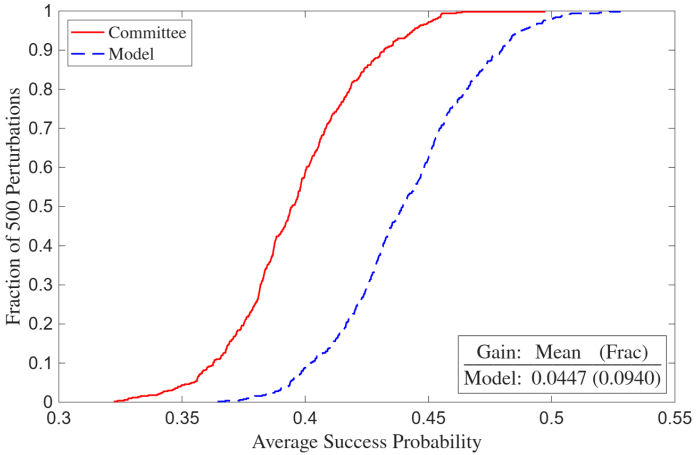

$$\widehat{\text{Winner's curse}} = \frac{1}{B}\sum_{b=1}^{B}\left[\overline{P}_{\mathcal{A}^R(\tilde{\theta}_{S,b}^U)}(\tilde{\theta}_{S,b}^U) - \overline{P}_{\mathcal{A}^R(\hat{\theta}_S^U)}(\tilde{\theta}_{S,b}^U)\right]$$

Theorem 4

Correction is exact in some cases and removes at least $\sqrt{2}-1$ of curse in expectation.

Deviation Gains Interpretation

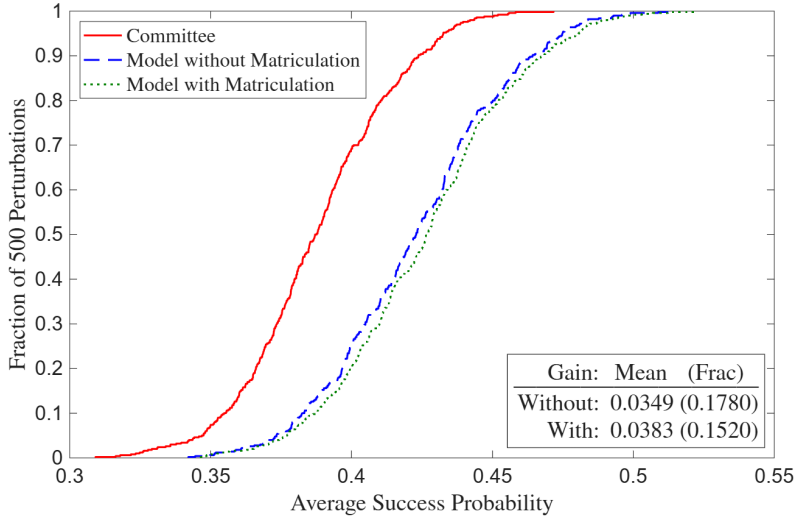

Deviation Gains (Acceptance Set)

- Random selection from applicant pool yields $\overline{P(\text{Success})} = 35\%$

» Acceptance vs. Success AMEs

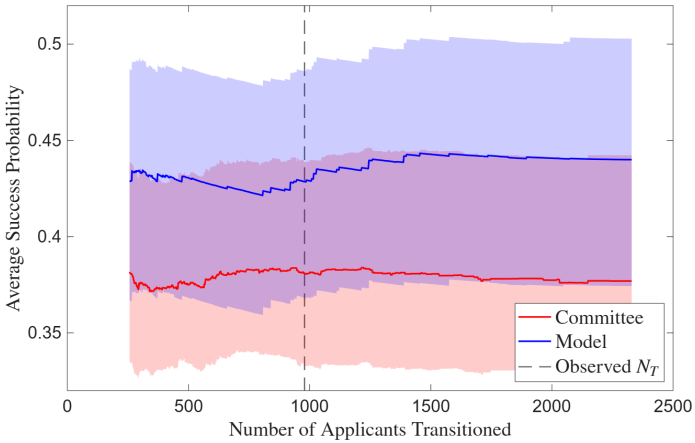

- Blue = underweighted, red = overweighted, white = neither
- AMEs don't reveal if committee deviates from optimal ranking near the cutoff

Benefit of Reading More Files (Acceptance Set)

- Suppose committee's curve is increasing and concave
- $\max_{n \in [N_A, N]} V N_A \overline{P}(n) - cn$
- **FOC:** $V = c/(N_A \overline{P}'(N_T))$
- V is dollar value of an additional expected success

Benefit of Reading More Files (Matriculation Set)

- Suppose committee's curve is increasing and concave
- $\max_{n \in [N_A, N]} VN_M\overline{P}(n) - cn$
- **FOC:** $V = c/(N_M\overline{P}'(N_T))$
- V is dollar value of an additional expected success

Conclusion

- **Economic Problem:** Selecting best options under costly evaluation
- **Application:** Graduate admissions using synthetic data protocol to protect privacy
- **Contribution:** Build models to assess optimality and quantify deviation gains
  1. On most dimensions, estimated success probabilities align with committee's decisions
  2. Reweighting some applicant characteristics could have increased admitted cohort's average success probability by 4 percentage points without reading more files
  3. Success is hard to predict, but even modest gains in selection are worthwhile

★ Methods apply to admissions, hiring, and other settings, especially those with more data, more predictable outcomes, or less effective decision-makers

⏩ Data Description

A1: Inference vs. Prediction

- Challenging to obtain consistent estimates due to omitted variables
  - **Example:** Don't observe effort (e.g. hours worked). Can bias coefficients upward if effort correlated with variables and with success irrespective of those variables
  - Existing literature also suffers from this problem, though BEMS (2022) parse recommendation letters for "grindstone terms" (e.g. depend*, diligen*)
- Research questions emphasize prediction over inference
  - Mullainathan & Spiess (2017) distinguish $\hat{\beta}$ vs. $\hat{y}$ problems
  - If GRE predicts success, committee should use it regardless of why

Data Description

A1: Sample Selection

- Determinants of success conditional on applying vs. matriculating
- BEMS (2022) prove that if $P(\text{Success}|\text{Skill})$ is an S-curve, then $\hat{\beta}$ will be smaller for more selected samples. Consistent with empirical results
- If there aren't some types of outcomes data (e.g. grades, passing comps) for all applicants, or such data are too hard to obtain, use Heckman correction
  - Let $y_n^* = w_n\beta + u_n$, $d_n = \mathbb{1}(q_n\gamma + v_n > 0)$, and $y_n = d_n y_n^*$, where $w = (x, z)$
  - **Step 1:** Run probit of d on q and compute inverse Mills $\hat{\lambda}_n = \frac{\phi(q_n\hat{\gamma})}{\Phi(q_n\hat{\gamma})}$
  - **Step 2:** Run OLS or heckprobit of y on $(w, \hat{\lambda})$ to get $\hat{\beta}$
  - **Instruments:** Variables that predict matriculation but not the outcome

» Regression Results

A1: Insufficiency of Comparing AMEs

- Cannot assess optimality by comparing AMEs across regressions. Suppose:
  - Work experience has large effect on success, graduate degree smaller effect
  - 25% of applicants have both, 25% experience only, 25% degree only, 25% neither
  - Committee can accept half of applicants, and other half attend different university
- Optimal committee accepts half with experience and ignores degree
  - **Acceptance Regression:** $\text{AME}_{\text{Experience}} = 1$, $\text{AME}_{\text{Degree}} = 0$
  - **Success Regression:** $1 > \text{AME}_{\text{Experience}} > \text{AME}_{\text{Degree}} > 0$
  - Despite optimality, acceptance and success AMEs not equal across regressions
- **Upshot:** Relationship between AMEs must be interpreted through a model

⏩ Acceptance vs. Success AMEs

A1: Diversity Objective

- **Demographics:** Squares vs. circles
- **Quality:** High vs. low

High Quality:

Low Quality:

⏩ Acceptance vs. Success AMEs

A1: Diversity Objective

- No preference for squares or circles

High Quality:

Low Quality:

Acceptance vs. Success AMEs

A1: Diversity Objective

- Small preference for squares $\Rightarrow$ consistent with maximizing quality

High Quality:

Low Quality:

Acceptance vs. Success AMEs

A1: Diversity Objective

- Large preference for squares $\Rightarrow$ inconsistent with maximizing quality

High Quality:

Low Quality:

⏩ Acceptance vs. Success AMEs

A1: Wald Tests

- Test if acceptance and/or success AMEs are same across PhD programs
  - **Example:** Does elite undergraduate university predict acceptance and/or success more or less for economics program than for other programs?
  - **Sample:** Applicants to university's economics, government, history, linguistics, and psychology PhD programs from 2020–2023 (when multi-program data is available)
- Can I test if acceptance AMEs equal success AMEs within programs?
  - Predictors of acceptance only (success only) may be overweighted (underweighted), provided committee wants to select based on a "success" model
  - **Problem:** Not a test if admissions decisions are optimal
  - **Solution:** Need model of admissions to assess optimality

⏩ Acceptance vs. Success AMEs

A1: Logistic Wald Test Across Programs

Assume $\left(Y^E \perp\!\!\!\perp Y^{NE}\right)\big|X$. Let $P\left(Y_n^E = 1\middle|x_n^E;\theta^E\right) = \frac{\exp(x_{n,0}^E\theta_0^E + x_{n,1}^E\theta_1^E)}{1+\exp(x_{n,0}^E\theta_0^E + x_{n,1}^E\theta_1^E)}$, and $P\left(Y_n^{NE} = 1\middle|x_n^{NE};\theta^{NE}\right) = \frac{\exp(x_{n,0}^{NE}\theta_0^{NE} + x_{n,1}^{NE}\theta_1^{NE})}{1+\exp(x_{n,0}^{NE}\theta_0^{NE} + x_{n,1}^{NE}\theta_1^{NE})}$. Finally, let $N = N_E + N_{NE}$. Then:

$$\mathcal{L}_N^U\left(y\middle|x;\theta\right) = \prod_{n=1}^{N_E} P\left(Y_n^E = 1\middle|x_n^E;\theta^E\right)^{Y_n^E}\left[1 - P\left(Y_n^E = 1\middle|x_n^E;\theta^E\right)\right]^{1-Y_n^E}$$
$$\prod_{n=1}^{N_{NE}} P\left(Y_n^{NE} = 1\middle|x_n^{NE};\theta^{NE}\right)^{Y_n^{NE}}\left[1 - P\left(Y_n^{NE} = 1\middle|x_n^{NE};\theta^{NE}\right)\right]^{1-Y_n^{NE}}.$$

- $Y \in \{\mathbb{1}(\textit{Accept}), \mathbb{1}(\textit{Attend Program}), \mathbb{1}(\textit{Complete Program}), \mathbb{1}(\textit{Good Placement})\}$
- **Test:** Let $g(\hat{\theta}) = \frac{1}{N_E}\sum_{n=1}^{N_E}\hat{P}_n^E(1-\hat{P}_n^E)\hat{\theta}_1^E - \frac{1}{N_{NE}}\sum_{n=1}^{N_{NE}}\hat{P}_n^{NE}(1-\hat{P}_n^{NE})\hat{\theta}_1^{NE}$. Then: $W = g(\hat{\theta})'\left[\nabla_\theta g(\hat{\theta})\hat{V}(\hat{\theta})\nabla_\theta g(\hat{\theta})'\right]^{-1} g(\hat{\theta}) \sim \chi_Q^2$. Compare AMEs per Mood (2010)

Insufficiency of Comparing AMEs

A1: Linear Wald Test Across Programs

Assume $\left(Y^E \perp\!\!\!\perp Y^{NE}\right)\big|X$, i.e. $\left(\text{Economics} \perp\!\!\!\perp \text{Non-Economics}\right)\big|\text{Predictors}$.
Let $f\left(y_n^E \middle| x_n^E; \beta^E, \sigma_E^2\right) = \frac{1}{\sqrt{2\pi\sigma_E^2}} \exp\left[\frac{-1}{2\sigma_E^2}\left(y_n^E - x_{n,0}^E \beta_0^E - x_{n,1}^E \beta_1^E\right)^2\right]$, and
$f\left(y_n^{NE} \middle| x_n^{NE}; \beta^{NE}, \sigma_{NE}^2\right) = \frac{1}{\sqrt{2\pi\sigma_{NE}^2}} \exp\left[\frac{-1}{2\sigma_{NE}^2}\left(y_n^{NE} - x_{n,0}^{NE} \beta_0^{NE} - x_{n,1}^{NE} \beta_1^{NE}\right)^2\right]$. Then:

$$\mathcal{L}_N^U\left(y \middle| x; \beta, \sigma^2\right) = \prod_{n=1}^{N_E} f\left(y_n^E \middle| x_n^E; \beta^E, \sigma_E^2\right) \prod_{n=1}^{N_{NE}} f\left(y_n^{NE} \middle| x_n^{NE}; \beta^{NE}, \sigma_{NE}^2\right).$$

- $Y \in \{\textit{Standardized Committee Score}, \textit{Standardized Placement Rank}\}$
- **Test:** Let $g(\hat{\beta}_1) = \hat{\beta}_1^E - \hat{\beta}_1^{NE}$. (Can also do likelihood-ratio test.)
  Then $\mathrm{W} = g(\hat{\beta}_1)'\left[\nabla_{\beta,\sigma^2} g(\hat{\beta}_1) \hat{V}(\hat{\beta}, \hat{\sigma}^2) \nabla_{\beta,\sigma^2} g(\hat{\beta}_1)'\right]^{-1} g(\hat{\beta}_1) \sim \chi_Q^2$
- **Assumption:** Homoskedasticity (i.e. $\forall n,\ \sigma_n^2 = \sigma^2$)

⏩ Insufficiency of Comparing AMEs

A1: Additional Questions

- Are there different determinants of different types of success? (AKKLP 2007)
  - Need different skills at different stages in the program, such as grades vs. placement
  - For some programs, initial placement matters less than for economics
- Different determinants for international applicants? (KW 2000)
  - **Admission:** May have different preparation and/or interests
  - **Completion:** Depending on country, may have fewer outside options
  - **Placement:** May return to native country after graduation
- Different determinants over time? (2015 to 2023)
  - COVID-19 and other macro factors; changes in professions (e.g. more empirics)
  - For economics, increased importance of elite predocs and Fed RAships

⏩ Insufficiency of Comparing AMEs

A2: Models of Admissions

1. **Dynamic Model:** Committee ranks applicants based on conditional expectation in Round 1 about those who survive to Round 2, reads files of those above Cutoff 1, and rejects the rest. Favors those in Round 1 with objective variables positively correlated with subjective variables that predict success. Then re-ranks survivors based on all variables, accepts survivors above Cutoff 2, and rejects the rest
    1. **Static Model:** In Round 1, rank applicants based only on objective variables
    2. **Myopic Model:** Like dynamic, but distribution of z not conditional on x
2. **Matriculation-Dynamic Model:** In Round 1, rank applicants based on combination of success and matriculation probabilities (largely success probabilities)

Dynamics

A2: Description of Models

- **Round 2:** If accept applicant, get success probability $P(y = S|x, z, t, \overline{k})$, where Success $= \mathbb{1}$(Complete Program) or $\mathbb{1}$(Good Placement). If reject applicant, get $P(y_2^* = S|t) = P$(Success) of year t's marginal accepted applicant

- **Round 1:** If reject applicant, get $L/P(y_1^* = S|t) = L/P$(Success) of year t's marginal transitioned applicant. Can be less or greater than $P(y_2^* = S|t)$ depending on value placed on committee's time vs. admitting a successful cohort
  - **Dynamic:** If transition applicant, get $\mathbb{E}[v_2(x, z, t, \overline{k}, \epsilon_2)|x, t, \overline{k}] =$ expected value of Round 2, where z is integrated out conditional on (x, t) based on $F(z|x, t)$
  - **Static:** If transition applicant, get $P(y = S|x, t, \overline{k})$, or P(Success) unconditional on z. It may differ from $P(y = S|x, z, t, \overline{k})$, though it still accounts for z's effect on y
  - **Myopic:** In $\mathbb{E}[v_2(x, z, t, \overline{k}, \epsilon_2)|x, t, \overline{k}]$, replace $F(z|x, t)$ with $F(z|t)$

Dynamics

A2: Lagrangian (BEMS 2022)

Portfolio Choice Problem:

$$\max_{(d_1,\ldots,d_N)\in\{A,R\}^N} \sum_{n=1}^{N} P(y_n = S|x_n, z_n)\mathbb{1}(d_n = A), \text{ where: } \sum_{n=1}^{N} \mathbb{1}(d_n = A) \leq N_A$$

$$\mathcal{L}(d_1, \ldots, d_N; \lambda) = \sum_{n=1}^{N} \left[P(y_n = S|x_n, z_n)\mathbb{1}(d_n = A) + \lambda\mathbb{1}(d_n = R)\right] + \lambda(N_A - N)$$

Cutoff Rule Solution:

$$\forall n \in \{1, \ldots, N\},\ d_n(x_n, z_n|\lambda^*) = \begin{cases} A & \text{if } P(y_n = S|x_n, z_n) > \lambda^* \\ \{A, R\} & \text{if } P(y_n = S|x_n, z_n) = \lambda^* \\ R & \text{if } P(y_n = S|x_n, z_n) < \lambda^* \end{cases}$$

Upshot: λ^* is cutoff probability. Denote it hereafter as $P(y^* = S)$

- $P(y^* = S) \in \left[P(y_{N_A+1} = S|x_{N_A+1}, z_{N_A+1}), P(y_{N_A} = S|x_{N_A}, z_{N_A})\right]$

Portfolio Choice to Cutoff Rule

A2: Lagrangian with Shocks

Portfolio Choice Problem:

$$\max_{(d_1,\ldots,d_N)\in\{A,R\}^N} \sum_{n=1}^{N} \left\{ \left[P(y_n = S|x_n, z_n) + \epsilon_n(A)\right]\mathbb{1}(d_n = A) + \epsilon_n(R)\mathbb{1}(d_n = R)\right\},$$

$$\text{where: } \sum_{n=1}^{N} \mathbb{1}(d_n = A) \leq N_A. \quad \text{Then: } \mathcal{L}(d_1, \ldots, d_N; \lambda) =$$

$$\sum_{n=1}^{N} \left\{ \left[P(y_n = S|x_n, z_n) + \epsilon_n(A)\right]\mathbb{1}(d_n = A) + \left[\lambda + \epsilon_n(R)\right]\mathbb{1}(d_n = R)\right\} + \lambda(N_A - N)$$

Cutoff Rule Solution:

$$\forall n \in \{1, \ldots, N\}, d_n(x_n, z_n, \epsilon_n|\lambda^*) = \begin{cases} A & \text{if } P(y_n = S|x_n, z_n) + \epsilon_n(A) > \lambda^* + \epsilon_n(R) \\ \{A, R\} & \text{if } P(y_n = S|x_n, z_n) + \epsilon_n(A) = \lambda^* + \epsilon_n(R) \\ R & \text{if } P(y_n = S|x_n, z_n) + \epsilon_n(A) < \lambda^* + \epsilon_n(R) \end{cases}$$

Theorem 5

For large N, there is a cutoff rule solution with logistic CCPs. Portfolio Choice to Cutoff Rule

A2: Lagrangian, Round 2

Portfolio Choice Problem:

$$\max_{(d_{2,1},\ldots,d_{2,N_T})\in\{A,R\}^{N_T}} \sum_{n=1}^{N_T} P(y_n = S|x_n, z_n)\mathbb{1}(d_{2,n} = A), \text{ where: } \sum_{n=1}^{N_T} \mathbb{1}(d_{2,n} = A) \leq N_A$$

$$\mathcal{L}(d_{2,1}, \ldots, d_{2,N_T}; \lambda_2) = \sum_{n=1}^{N_T} \left[P(y_n = S|x_n, z_n)\mathbb{1}(d_{2,n} = A) + \lambda_2 \mathbb{1}(d_{2,n} = R)\right] + \lambda_2(N_A - N_T)$$

Cutoff Rule Solution:

$$\forall n \in \{1, \ldots, N_T\},\ d_{2,n}(x_n, z_n|\lambda_2^*) = \begin{cases} A & \text{if } P(y_n = S|x_n, z_n) > \lambda_2^* \\ \{A, R\} & \text{if } P(y_n = S|x_n, z_n) = \lambda_2^* \\ R & \text{if } P(y_n = S|x_n, z_n) < \lambda_2^* \end{cases}$$

Upshot: λ_2^* is cutoff probability. Denote it hereafter as $P(y_2^* = S)$

- $P(y_2^* = S) \in \left[P(y_{N_A+1} = S|x_{N_A+1}, z_{N_A+1}), P(y_{N_A} = S|x_{N_A}, z_{N_A})\right]$

Portfolio Choice to Cutoff Rule

A2: Lagrangian, Round 1 (Dynamic)

Portfolio Choice Problem:

$$\max_{(d_{1,1},\ldots,d_{1,N})\in\{T,R\}^N} \sum_{n=1}^{N} EV_{2,n}(x_n;\overline{\lambda_2^*})\mathbb{1}(d_{1,n}=T), \text{ where: } \sum_{n=1}^{N}\mathbb{1}(d_{1,n}=T)\leq N_T, \text{ where:}$$

$$EV_{2,n}(x_n)=\int_{\widetilde{z}_n}\max\{P(y_n=S|x_n,\widetilde{z}_n),\overline{\lambda_2^*}\}dF_{z|x}(\widetilde{z}_n|x_n)$$

$$\mathcal{L}(d_{1,1},\ldots,d_{1,N};\lambda_1)=\sum_{n=1}^{N}\left[EV_{2,n}(x_n)\mathbb{1}(d_{1,n}=T)+\lambda_1\mathbb{1}(d_{1,n}=R)\right]+\lambda_1(N_T-N)$$

Cutoff Rule Solution:

$$\forall n\in\{1,\ldots,N\},\ d_{1,n}(x_n|\lambda_1^*)=\begin{cases}T & \text{if } EV_{2,n}(x_n)>\lambda_1^*\\ \{T,R\} & \text{if } EV_{2,n}(x_n)=\lambda_1^*\\ R & \text{if } EV_{2,n}(x_n)<\lambda_1^*\end{cases}$$

Upshot: λ_1^* is cutoff level. Denote it hereafter as $L(y_1^*=S)\in\left[EV_{2,N_T+1},EV_{2,N_T}\right]$

Portfolio Choice to Cutoff Rule

A2: Lagrangian, Round 1 (Static)

Portfolio Choice Problem:

$$\max_{(d_{1,1},\ldots,d_{1,N})\in\{T,R\}^N} \sum_{n=1}^{N} P(y_n = S|x_n)\mathbb{1}(d_{1,n} = T), \text{ where: } \sum_{n=1}^{N} \mathbb{1}(d_{1,n} = T) \leq N_T$$

$$\mathcal{L}(d_{1,1},\ldots,d_{1,N};\lambda_1) = \sum_{n=1}^{N} \left[P(y_n = S|x_n)\mathbb{1}(d_{1,n} = T) + \lambda_1\mathbb{1}(d_{1,n} = R)\right] + \lambda_1(N_T - N)$$

Cutoff Rule Solution:

$$\forall n \in \{1,\ldots,N\},\ d_{1,n}(x_n|\lambda_1^*) = \begin{cases} T & \text{if } P(y_n = S|x_n) > \lambda_1^* \\ \{T,R\} & \text{if } P(y_n = S|x_n) = \lambda_1^* \\ R & \text{if } P(y_n = S|x_n) < \lambda_1^* \end{cases}$$

Upshot: λ_1^* is cutoff probability. Denote it hereafter as $P(y_1^* = S)$

- $P(y_1^* = S) \in \left[P(y_{N_T+1} = S|x_{N_T+1}), P(y_{N_T} = S|x_{N_T})\right]$

Portfolio Choice to Cutoff Rule

A2: Dynamic Parameterization 1

Unrestricted CCPs:

$$P_{d_1} = P\big(d_1 = T \big| x, t; \theta_T\big) = \frac{\exp(f_T(x,t)\theta_T)}{1 + \exp(f_T(x,t)\theta_T)}$$

$$P_{d_2} = P\big(d_2 = A \big| x, z, t; \theta_A\big) = \frac{\exp(f_A(x,z,t)\theta_A)}{1 + \exp(f_A(x,z,t)\theta_A)}$$

Success Probability:

$$P_y = P\big(y = S \big| x, z, t, k; \theta_S\big) = \frac{\exp(f_S(x,z,t,k)\theta_S)}{1 + \exp(f_S(x,z,t,k)\theta_S)}$$

Cutoff Level/Probability:

$$L_{y_1^*} = L\big(y_1^* = S \big| t; \theta_{S_1^*}\big) = \exp(f_{S_1^*}(t)\theta_{S_1^*})$$

$$P_{y_2^*} = P\big(y_2^* = S \big| t; \theta_{S_2^*}\big) = \frac{\exp(f_{S_2^*}(t)\theta_{S_2^*})}{1 + \exp(f_{S_2^*}(t)\theta_{S_2^*})}$$

Dynamic Model

A2: Dynamic Parameterization 2

$$\mathbb{E}[v_2(x,z,t,\overline{k},\epsilon_2)|x,t,\overline{k}] = \int_{\widetilde{z}} \sigma \log\left(\sum_{\widetilde{d_2}\in\{A,R\}} e^{u_2(x,\widetilde{z},t,\overline{k},\widetilde{d_2})/\sigma}\right) dF(\widetilde{z}|x,t)$$

$$= \int_{\widetilde{z_1}} \cdots \int_{\widetilde{z_J}} \left[\cdot\right] dF_1(\widetilde{z_1}|\widetilde{z_2},\ldots,\widetilde{z_J},x,t)\cdots dF_J(\widetilde{z_J}|x,t)$$

- **Binary:** Logistic regression on (x,t), so binary z's are independent given (x,t)
- **Continuous:** Jointly normal given (x,t) and binary z's
- **Computation:** Sum over configurations of binary z's, with 15-node Gauss–Hermite quadrature on $f_S(x,z,t,\overline{k})\theta_S$

Dynamic Model

A2: Dynamic Likelihood

$$\mathcal{L}_N^U(\theta) = \prod_{n=1}^{N_T} \underbrace{f\left(z_n^c | z_n^{\neg c}, x_n, t_n; \theta_F\right)}_{\text{Density of } z^c | z^{\neg c}, x, t} \underbrace{P_{d_{1,n}}(\theta_T) P_{d_{2,n}}(\theta_A)^{\mathbb{1}(d_{2,n}=A)} (1 - P_{d_{2,n}}(\theta_A))^{\mathbb{1}(d_{2,n}=R)}}_{\text{Conditional choice probabilities}}$$

$$\prod_{n=N_T+1}^{N} \underbrace{\left(1 - P_{d_{1,n}}(\theta_T)\right)}_{\text{Conditional choice probability}} \prod_{n=1}^{N} \underbrace{f\left(z_n^{\neg c} | x_n, t_n; \theta_F\right)}_{\text{Density of } z^{\neg c} | x, t} \underbrace{P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)} (1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)}}_{\text{Success probabilities}}$$

- Success mostly unobservable for applicants from fewer than six years ago

Maximum Likelihood Estimation

A2: Heckman (1979)-Corrected Dynamic Likelihood

$$\mathcal{L}_N^U(\theta) = \prod_{n=1}^{N_T} \underbrace{\Phi(x_n, t_n; \theta_H)}_{\text{Selection}} \underbrace{f\left(z_n | x_n, t_n, \frac{\phi(x_n, t_n; \theta_H)}{\Phi(x_n, t_n; \theta_H)}; \theta_F\right)}_{\text{Density of } z|x,t} \underbrace{P_{d_{1,n}}(\theta_T) P_{d_{2,n}}(\theta_A)^{\mathbb{1}(d_{2,n}=A)}}_{\text{Conditional choice probabilities}}$$

$$\underbrace{\left(1 - P_{d_{2,n}}(\theta_A)\right)^{\mathbb{1}(d_{2,n}=R)}}_{\text{Conditional choice probability}} \prod_{n=N_T+1}^{N} \underbrace{\left(1 - \Phi(x_n, t_n; \theta_H)\right)}_{\text{Selection}} \underbrace{f\left(z_n^{\neg c} | x_n, t_n, \frac{-\phi(x_n, t_n; \theta_H)}{1 - \Phi(x_n, t_n; \theta_H)}; \theta_F\right)}_{\text{Density of } z^{\neg c}|x,t}$$

$$\underbrace{\left(1 - P_{d_{1,n}}(\theta_T)\right)}_{\text{Conditional choice probability}} \prod_{n=1}^{N} \underbrace{P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)} \left(1 - P_{y_n}(\theta_S)\right)^{\mathbb{1}(y_n=F)}}_{\text{Success probabilities}}$$

- *Committee Score* unobservable for applicants who didn't survive Round 1

Maximum Likelihood Estimation

A2: Static Model

- **Motivation:** Interpretable cutoff probabilities in both rounds

Round 2:

$$v_2(x, z, t, \overline{k}, \epsilon_2) = \max_{d_2 \in \{A,R\}} u_2(x, z, t, \overline{k}, d_2) + \epsilon_2(d_2), \text{ where:}$$

$$u_2(x, z, t, \overline{k}, d_2) = \underbrace{P(y = S|x, z, t, \overline{k})\mathbb{1}(d_2 = A)}_{\text{If accept, get } P(\text{Success})} + \underbrace{P(y_2^* = S|t)\mathbb{1}(d_2 = R)}_{\text{If reject, get } P(\text{Cutoff})}$$

Round 1:

$$v_1(x, t, \overline{k}, \epsilon_1) = \max_{d_1 \in \{T,R\}} u_1(x, t, \overline{k}, d_1) + \epsilon_1(d_1), \text{ where:}$$

$$u_1(x, t, \overline{k}, d_1) = \underbrace{P(y = S|x, t, \overline{k})\mathbb{1}(d_1 = T)}_{\text{If transition, get } P(\text{Success})} + \underbrace{P(y_1^* = S|t)\mathbb{1}(d_1 = R)}_{\text{If reject, get } P(\text{Cutoff})}$$

- $P(y = S|x, t, \overline{k})$ estimates inconsistent, but fitted values account for z's effect on y

Dynamic Model

A2: Static Likelihood

$$\mathcal{L}_N^U(\theta) = \prod_{n=1}^{N_T} \underbrace{P_{d_{1,n}}(\theta_T) P_{d_{2,n}}(\theta_A)^{\mathbb{1}(d_{2,n}=A)} (1 - P_{d_{2,n}}(\theta_A))^{\mathbb{1}(d_{2,n}=R)}}_{\text{Conditional choice probabilities}} \prod_{n=N_T+1}^{N} \underbrace{\left(1 - P_{d_{1,n}}(\theta_T)\right)}_{\text{Conditional choice probability}}$$

$$\prod_{n=1}^{N} \underbrace{\left[P_{y_n}(\theta_{S_1}) P_{y_n}(\theta_{S_2})\right]^{\mathbb{1}(y_n=S)} \left[(1 - P_{y_n}(\theta_{S_1}))(1 - P_{y_n}(\theta_{S_2}))\right]^{\mathbb{1}(y_n=F)}}_{\text{Success probabilities}}$$

- Success mostly unobservable for applicants from fewer than six years ago

Maximum Likelihood Estimation

A2: Lagrangian with Matriculation

Portfolio Choice Problem:

$$\max_{(d_1,\ldots,d_N)\in\{A,R\}^N} \sum_{n=1}^{N} P(y_n = S|w_n)P(m_n = M|w_n)\mathbb{1}(d_n = A),$$

$$\text{where: } \sum_{n=1}^{N} P(m_n = M|w_n)\mathbb{1}(d_n = A) \leq N_M, \text{ and } w = (x, z)$$

$$\mathcal{L}(d_1,\ldots,d_N;\lambda) = \sum_{n=1}^{N} \left[P(y_n = S|w_n)\mathbb{1}(d_n = A)+\lambda\mathbb{1}(d_n = R)\right]P(m_n = M|w_n)+\lambda(N_M-\overline{N_M})$$

Cutoff Rule Solution:

$$\forall n \in \{1,\ldots,N\},\ d_n(w_n|\lambda^*) = \begin{cases} A & \text{if } P(y_n = S|w_n) > \lambda^* \\ \{A,R\} & \text{if } P(y_n = S|w_n) = \lambda^* \\ R & \text{if } P(y_n = S|w_n) < \lambda^* \end{cases}$$

Cutoff Rule with Matriculation

A2: Lagrangian with Matriculation (Large N)

Portfolio Choice Problem:

$$\max_{\delta \in \{\delta | \delta: \mathbb{R}^K \to [0,1]\}} \int_{w \in \mathbb{R}^K} P(y = S|w) P(m = M|w) \delta(w) f(w) dw,$$

$$\text{where: } \int_{w \in \mathbb{R}^K} P(m = M|w) \delta(w) f(w) dw \leq N_M$$

$$\mathcal{L}(\delta; \lambda) = \int_{w \in \mathbb{R}^K} \left[P(y = S|w) \delta(w) + \lambda (1 - \delta(w)) \right] P(m = M|w) f(w) dw + \lambda (N_M - \overline{N_M})$$

Cutoff Rule Solution:

$$\forall w \in \mathbb{R}^K,\ \delta(w|\lambda^*) = \begin{cases} 1 & \text{if } P(y = S|w) > \lambda^* \\ [0,1] & \text{if } P(y = S|w) = \lambda^* \\ 0 & \text{if } P(y = S|w) < \lambda^* \end{cases}$$

Upshot: Point-identified cutoff probability λ^* is with respect to success probabilities

Cutoff Rule with Matriculation

A2: Lagrangian with Matriculation, Round 2

Portfolio Choice Problem:

$$\max_{(d_{2,1},\ldots,d_{2,N_T})\in\{A,R\}^{N_T}} \sum_{n=1}^{N_T} P(y_n = S|w_n)P(m_n = M|w_n)\mathbb{1}(d_{2,n} = A),$$

$$\text{where: } \sum_{n=1}^{N_T} P(m_n = M|w_n)\mathbb{1}(d_{2,n} = A) \leq N_M$$

$$\mathcal{L}(d_{2,1},\ldots,d_{2,N_T};\lambda_2) = \sum_{n=1}^{N_T} \left[P(y_n = S|w_n)\mathbb{1}(d_{2,n} = A) + \lambda_2\mathbb{1}(d_{2,n} = R)\right] P(m_n = M|w_n) + \lambda_2(N_M - \overline{N_M})$$

Cutoff Rule Solution:

$$\forall n \in \{1,\ldots,N_T\},\ d_{2,n}(w_n|\lambda_2^*) = \begin{cases} A & \text{if } P(y_n = S|w_n) > \lambda_2^* \\ \{A,R\} & \text{if } P(y_n = S|w_n) = \lambda_2^* \\ R & \text{if } P(y_n = S|w_n) < \lambda_2^* \end{cases}$$

» Cutoff Rule with Matriculation

A2: Lagrangian with Matriculation, Round 1

Portfolio Choice Problem:

$$\max_{(d_{1,1},\ldots,d_{1,N})\in\{T,R\}^N} \sum_{n=1}^{N} EV_{2,n}(x_n;\overline{\lambda_2^*})\mathbb{1}(d_{1,n}=T), \text{ where: } \sum_{n=1}^{N}\mathbb{1}(d_{1,n}=T)\leq N_T, \text{ where:}$$

$$EV_{2,n}(x_n)=\int_{\widetilde{z}_n}\max\{P(y_n=S|x_n,\widetilde{z}_n)-\overline{\lambda_2^*},0\}P(m_n=M|x_n,\widetilde{z}_n)dF_{z|x}(\widetilde{z}_n|x_n)$$

$$\mathcal{L}(d_{1,1},\ldots,d_{1,N};\lambda_1)=\sum_{n=1}^{N}\left[EV_{2,n}(x_n)\mathbb{1}(d_{1,n}=T)+\lambda_1\mathbb{1}(d_{1,n}=R)\right]+\lambda_1(N_T-N)$$

Cutoff Rule Solution:

$$\forall n\in\{1,\ldots,N\},\ d_{1,n}(x_n|\lambda_1^*)=\begin{cases}T & \text{if } EV_{2,n}(x_n)>\lambda_1^*\\ \{T,R\} & \text{if } EV_{2,n}(x_n)=\lambda_1^*\\ R & \text{if } EV_{2,n}(x_n)<\lambda_1^*\end{cases}$$

Cutoff Rule with Matriculation

A2: Matriculation-Dynamic Likelihood

Matriculation Probability:

$$P_m = P\big(m = M \big| x, z, t; \theta_M\big) = \frac{\exp(f_M(x, z, t)\theta_M)}{1 + \exp(f_M(x, z, t)\theta_M)}$$

$$\mathcal{L}_N^U(\theta) = \prod_{n=1}^{N_A} \underbrace{P_{m_n}(\theta_M)^{\mathbb{1}(m_n=M)}(1 - P_{m_n}(\theta_M))^{\mathbb{1}(m_n=D)}}_{\text{Matriculation probabilities}}$$

$$\prod_{n=1}^{N_T} \underbrace{f\left(z_n^c | z_n^{\neg c}, x_n, t_n; \theta_F\right)}_{\text{Density of } z^c|z^{\neg c}, x, t} \underbrace{P_{d_{1,n}}(\theta_T) P_{d_{2,n}}(\theta_A)^{\mathbb{1}(d_{2,n}=A)}(1 - P_{d_{2,n}}(\theta_A))^{\mathbb{1}(d_{2,n}=R)}}_{\text{Conditional choice probabilities}}$$

$$\prod_{n=N_T+1}^{N} \underbrace{\left(1 - P_{d_{1,n}}(\theta_T)\right)}_{\text{Conditional choice probability}} \prod_{n=1}^{N} \underbrace{f\left(z_n^{\neg c} | x_n, t_n; \theta_F\right)}_{\text{Density of } z^{\neg c}|x, t} \underbrace{P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)}(1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)}}_{\text{Success probabilities}}$$

Maximum Likelihood Estimation

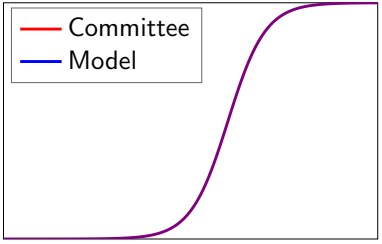

A2: Empirical Considerations

- **Selection Effects:** Track success for all applicants, including non-matriculants
  - In selected samples, success parameters are biased down (e.g. quantitative GRE)
- **Potential Outcomes:** Track which graduate program all applicants attended, and add *Program Rank* as a control variable in success blocks of likelihood
  - In decision blocks containing success, fix *Program Rank* at this university's rank
  - If a variable only predicts success by helping applicant get into elite graduate program, then committee should not use that variable to rank applicants
- **Unobservables:** I may not observe all information that committee observes
  - **Example:** Recommendation letter has nuances that algorithms can't detect
  - Include subjective committee score in z as a proxy for this information

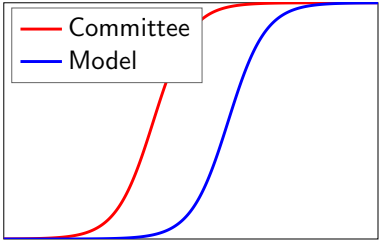

⏩ Maximum Likelihood Estimation

A2: Deviation Gains Procedure

1. Write Bellman equations for committee's optimization problem
2. Estimate parameters. Rationality assumption distorts estimates
3. Re-estimate parameters without rationality, and use to solve model
4. Compare selections from model's decision rule to committee's decision rule
5. For this comparison, evaluate selections at perturbations of estimates

Optimal Committee

Suboptimal Committee

Deviation Gains

A2: Deviation Gains Algorithm

Dynamic/Static/Myopic:

1. Rank each t's applicants by $\mathbb{E}[v_2(x, z, t, \overline{k}, \epsilon_2)|x, t, \overline{k}]$ with $\sigma = 0$ for dynamic and myopic, or $P(y = S|x, t, \overline{k})$ for static. Transition top N_T, and reject the rest
2. Rank surviving applicants by $P(y = S|x, z, t, \overline{k})$, and accept top N_A survivors. Compute $\overline{P(y = S|x, z, t, \overline{k})}$ of acceptance set, and compare to committee's set

Matriculation-Dynamic/Static:

1. Rank each t's applicants by $\mathbb{E}[v_2(x, z, t, \overline{k}, \epsilon_2)|x, t, \overline{k}]$ with $\sigma = 0$ for dynamic, or $P(y = S|x, t, \overline{k})$ for static (best analogue). Transition top N_T, and reject the rest
2. Rank surviving applicants by $P(y = S|x, z, t, \overline{k})$ and accept them in descending order, each matriculating with probability $P(m = M|x, z, t)$, until N_M matriculate. Compute $\overline{P(y = S|x, z, t, \overline{k})}$ of matriculation set, and compare to committee's set

Deviation Gains

A2: Deviation Gains Interpretation

- Under meaningfully-sized deviation gains, committee may have incorrect beliefs about which types of applicants are most likely to succeed
  - Too few observations for a true out-of-sample test, and cannot account for changes in the determinants of success over time, such as writing essays with AI
- Committee may use success-predicting variables that I do not observe
  - Because the success probability measure used to evaluate gains cannot detect such variables, any edge the committee's private information provides goes unmeasured
  - Comprehensive data, especially committee score in z, protects against this limitation

⏩ Deviation Gains Correction

A2: Extensions

- **Extension 1:** Uncover additional variables that predict matriculation but not failure
  - **Example:** Applicants with work experience more likely to succeed and matriculate
  - Can help committee find "people that we can afford" (*Moneyball*)
- **Extension 2:** Relax assumption that committee maximizes $P(\text{Success})$
  - Instead maximize combination of $P(\text{Success})$ and other objectives
  - **Example:** Committee may value diverse applicants (e.g. across fields): $\alpha P(\text{Success}) + (1-\alpha)\text{Diversity}$, where $\alpha \in [0,1]$ can be estimated
- **Extension 3:** Waitlist and multiyear models (see online appendix)
  - Three-round models, and two-round models that repeat over infinite horizon
  - States contain info about past rounds/years, and committee values future rounds/years (memory includes matriculation probability and diversity)

Conclusion
