

Optimal Dynamic Selection Under Costly Evaluation: Evidence from Graduate Admissions

Jeremy Rosen

Georgetown University

April 19, 2026

Motivation

- **Economic Problem:** Selecting best options under costly evaluation
 - Determining each option's true quality costs decision-maker time and effort
 - Low-cost screening of all options $\Rightarrow$ high-cost evaluation of surviving options
 - **Examples:** Admissions and hiring, clinical trials, matching platforms
- **Why Graduate Admissions:** Benefits graduate programs and future applicants
 - Graduate programs invest time and money into students' development
 - If programs were undervaluing applicants with certain characteristics, future such applicants may receive formerly-withheld opportunities

Research Questions

- ❶ Which factors in applications affect admission and success in graduate school?
 - Literature measures success with program completion and job placement ranking
 - ❷ Are admissions committees optimizing, or are they making mistakes?
 - Goal is to accept applicants with highest success probabilities who will matriculate
 - Predictors of admission only (success only) may be overvalued (undervalued)
 - ❸ If they are making mistakes, how can they make better admissions decisions?
 - In turn, by changing decision rules, how much better of a cohort can they admit?
- ★ This paper's methods generalize to admissions, hiring, and other settings

Methodology and Main Results

- Develop structural models of admissions committee's decision problem that support:
 - Statistical tests of whether committee's decision rule aligns with desired objective
 - Counterfactual simulations quantifying gains from deviating to model's decision rule
- Estimate models with admissions data from a major research university
 - Tests reject optimality and counterfactual deviation gains statistically significant when committee misvalues applicant characteristics, but not when it optimizes
 - Synthetic data protocol protects applicants' privacy, and is first complete framework for researchers conducting structural estimation on data they cannot directly access

Literature Review

- **Graduate Admissions:** Regress acceptance and success on applicant characteristics
 - **Original Literature:** Attiyeh & Attiyeh (1997); Krueger & Wu (2000); Grove & Wu (2007); Athey, Katz, Krueger, Levitt & Poterba (2007)
 - **Study of 2002 Cohort:** Stock, Finegan & Siegfried (2006–2015)
 - **New Predictors/Methods:** Bai, Esche, MacLeod & Shi (2022)
- **Optimal Dynamic Selection Under Costly Evaluation:**
 - **Sequential Search:** McCall (1970); Mortensen (1970); Weitzman (1979)
 - **Rational Inattention:** Sims (2003); Matějka & McKay (2015); Caplin & Dean (2015)
- ★ **This Paper:** Builds and estimates dynamic selection models of graduate admissions

Synthetic Data Protocol (IRB-Approved)

① Administrative office receives data from university departments

- Algorithmically extracts variables from textual files, such as recommendation letters

② Synthetic data (Patki et al. 2016) used for model development

- Estimate joint distribution of variables, and simulate synthetic dataset from it
- Rows do not correspond to real subjects, preventing identity disclosure
- Cells with < 5 comparable observations binned to prevent attribute disclosure

③ Administrative office executes final estimation code on actual data

- Only summary statistics and parameter estimates are returned to researcher

★ **Contribution:** Privacy-protecting framework for researchers studying sensitive data

Outline

- 1 Reduced-Form Analysis
- 2 Structural Models
- 3 Structural Estimation
- 4 Optimality Tests

Data Description

- **Sample:** Applicants to research university's economics, government, history, linguistics, and psychology PhD programs from 2015 to 2023
- **Dependent Variables:** Measures of admission and success
 - **Admission:** Indicators for all stages of admissions process, including waitlist
 - **Success:** Completion and placement category/quality for **all** applicants, with academia-equivalent rankings for non-academic placements (Krueger & Wu 2000)
- **Independent Variables:** Objective vs. subjective
 - **Objective:** Demographics and performance measures, such as GRE scores
 - **Subjective:** Textual processing of recommendation letters, application essays, CVs, and supplemental forms using dictionaries to construct variables

Reduced-Form Summary

- **Data:** All applicants to all 5 graduate programs from 2020 to 2023
 - Currently have results for acceptance and objective variables only
 - Implementing synthetic data protocol to complete the empirical work
- **Method:** Logistic regressions with lasso for variable selection
- **Results:** Economics admissions cares most about quantitative GRE and undergraduate GPA, and is most data-driven based on goodness of fit
 - Need success data to see if other programs are making mistakes
 - Prolific recommenders increase acceptance probability $\Rightarrow$ network effects

- Admissions literature regresses acceptance and success on variables in applications, and qualitatively compares the effects
- While such comparisons are of interest, they are insufficient to test optimality
- Need model of admissions to relate acceptance effects to success effects

► Insufficiency of Comparing AMEs

Outline

- 1 Reduced-Form Analysis
- 2 Structural Models**
- 3 Structural Estimation
- 4 Optimality Tests

Why Structural Models?

- **Reason 1:** Test whether committee's decision rule aligns with desired objective
 - Per literature, committee should accept applicants with highest success probabilities
 - Committees also accept applicants with higher matriculation probabilities
- **Reason 2:** Find counterfactual decision rule in which committee optimizes
 - Quantify gains from deviating from actual to counterfactual decision rule

Structural Framework

- **Portfolio Choice Problem:** Accept subset of applicants with highest sum of success probabilities subject to capacity constraint on number of acceptances
- For each applicant $n \in \{1, \dots, N\}$, make decision $d_n \in \{\text{Accept}, \text{Reject}\}$ given:

$$\max_{(d_1, \dots, d_N) \in \{A, R\}^N} \sum_{n=1}^N \underbrace{P(y_n = S | x_n, z_n)}_{\text{Success probability}} \underbrace{\mathbb{1}(d_n = A)}_{\text{Acceptance}}, \text{ such that: } \sum_{n=1}^N \underbrace{\mathbb{1}(d_n = A)}_{\text{Acceptance}} \leq N_A,$$

where x = objective variables, z = subjective variables, $y \in \{\text{Success}, \text{Failure}\}$,
 N = number of applicants, and N_A = maximum number of acceptances

Structural Framework

- **Portfolio Choice Problem:** Accept subset of applicants with highest sum of success probabilities subject to capacity constraint on number of acceptances

$$\max_{(d_1, \dots, d_N) \in \{A, R\}^N} \sum_{n=1}^N \underbrace{P(y_n = S | x_n, z_n)}_{\text{Success probability}} \underbrace{\mathbb{1}(d_n = A)}_{\text{Acceptance}}, \text{ such that: } \sum_{n=1}^N \underbrace{\mathbb{1}(d_n = A)}_{\text{Acceptance}} \leq N_A$$

- BEMS (2022) prove that portfolio choice problem reduces to cutoff rule problem
 - Accept applicant if and only if their success probability exceeds cutoff probability
 - Decisions across applicants now independent, so no need to consider all subsets

►► Portfolio Choice to Cutoff Rule

Cutoff Rule Problem

- Start with two-round cutoff rule problem that accounts for costly evaluation:
 - **Round 1:** See only objective variables (e.g. GRE). Can transition application file to Round 2 to see subjective variables (e.g. recommendation letters), or can reject
 - **Round 2:** If chose to transition application file in Round 1, can accept or reject
 - Assume for now committee transitions and accepts optimal number of files
- Along with the baseline dynamic model, there are two additional models
 - Static model makes it possible to compare cutoff probabilities across rounds
 - Waitlist model adds a third round and accounts for matriculation probabilities

Decision Graph

Dynamic Model

- **States:** r = round, x = objective variables, z = subjective variables, t = year, ϵ_r = Type 1 extreme value preference shock with scale parameter σ
- **Controls:** $d_1 \in \{\text{Transition, Reject}\}$, $d_2 \in \{\text{Accept, Reject}\}$
- **Outcomes:** $y \in \{\text{Success, Failure}\}$, y_r^* = marginal outcome

►► Dynamic Parameterization

Dynamic Model

- **States:** $r = \text{round}$, $x = \text{objective variables}$, $z = \text{subjective variables}$, $t = \text{year}$, $\epsilon_r = \text{Type 1 extreme value preference shock with scale parameter } \sigma$
- **Controls:** $d_1 \in \{\text{Transition, Reject}\}$, $d_2 \in \{\text{Accept, Reject}\}$
- **Outcomes:** $y \in \{\text{Success, Failure}\}$, $y_r^* = \text{marginal outcome}$

Round 2:

$$v_2(x, z, t, \epsilon_2) = \max_{d_2 \in \{A, R\}} u_2(x, z, t, d_2) + \epsilon_2(d_2), \text{ such that:}$$

$$u_2(x, z, t, d_2) = \underbrace{P(y = S|x, z)\mathbb{1}(d_2 = A)}_{\text{If accept, get } P(\text{Success})} + \underbrace{P(y_2^* = S|t)\mathbb{1}(d_2 = R)}_{\text{If reject, get } P(\text{Cutoff})}$$

Dynamic Model

Round 1:

$$v_1(x, t, \epsilon_1) = \max_{d_1 \in \{T, R\}} u_1(x, t, d_1) + \epsilon_1(d_1), \text{ such that:}$$

$$u_1(x, t, d_1) = \underbrace{\mathbb{E}[v_2(x, z, t, \epsilon_2)|x, t]\mathbb{1}(d_1 = T)}_{\text{If transition, get } \mathbb{E}[\text{Social Surplus}]} + \underbrace{L(y_1^* = S|t)\mathbb{1}(d_1 = R)}_{\text{If reject, get } L(\text{Cutoff})}, \text{ such that:}$$

$$\mathbb{E}[v_2(x, z, t, \epsilon_2)|x, t] = \int_{\tilde{z}} \sigma \log \left(e^{P(y=S|x, \tilde{z})/\sigma} + e^{P(y_2^*=S|t)/\sigma} \right) dF(\tilde{z}|x)$$

» Dynamic Parameterization

Dynamic Model

Round 1:

$$v_1(x, t, \epsilon_1) = \max_{d_1 \in \{T, R\}} u_1(x, t, d_1) + \epsilon_1(d_1), \text{ such that:}$$

$$u_1(x, t, d_1) = \underbrace{\mathbb{E}[v_2(x, z, t, \epsilon_2)|x, t]\mathbb{1}(d_1 = T)}_{\text{If transition, get } \mathbb{E}[\text{Social Surplus}]} + \underbrace{L(y_1^* = S|t)\mathbb{1}(d_1 = R)}_{\text{If reject, get } L(\text{Cutoff})}, \text{ such that:}$$

$$\mathbb{E}[v_2(x, z, t, \epsilon_2)|x, t] = \int_{\tilde{z}} \sigma \log \left(e^{P(y=S|x, \tilde{z})/\sigma} + e^{P(y_2^*=S|t)/\sigma} \right) dF(\tilde{z}|x)$$

Conditional Choice Probabilities:

$$P(d_r|x, (z), t) = \frac{\exp(u_r(x, (z), t, d_r)/\sigma)}{\sum_{\tilde{d}_r \in D_r} \exp(u_r(x, (z), t, \tilde{d}_r)/\sigma)}$$

- **Goal:** Make Round 1 cutoff a probability bounded between 0 and 1

» Static Parameterization

Static Model

- **Goal:** Make Round 1 cutoff a probability bounded between 0 and 1

Round 2:

$$v_2(x, z, t, \epsilon_2) = \max_{d_2 \in \{A, R\}} u_2(x, z, t, d_2) + \epsilon_2(d_2), \text{ such that:}$$

$$u_2(x, z, t, d_2) = \underbrace{P(y = S|x, z)\mathbb{1}(d_2 = A)}_{\text{If accept, get } P(\text{Success})} + \underbrace{P(y_2^* = S|t)\mathbb{1}(d_2 = R)}_{\text{If reject, get } P(\text{Cutoff})}$$

► Static Parameterization

Static Model

- **Goal:** Make Round 1 cutoff a probability bounded between 0 and 1

Round 2:

$$v_2(x, z, t, \epsilon_2) = \max_{d_2 \in \{A, R\}} u_2(x, z, t, d_2) + \epsilon_2(d_2), \text{ such that:}$$

$$u_2(x, z, t, d_2) = \underbrace{P(y = S|x, z)\mathbb{1}(d_2 = A)}_{\text{If accept, get } P(\text{Success})} + \underbrace{P(y_2^* = S|t)\mathbb{1}(d_2 = R)}_{\text{If reject, get } P(\text{Cutoff})}$$

Round 1:

$$v_1(x, t, \epsilon_1) = \max_{d_1 \in \{T, R\}} u_1(x, t, d_1) + \epsilon_1(d_1), \text{ such that:}$$

$$u_1(x, t, d_1) = \underbrace{P(y = S|x)\mathbb{1}(d_1 = T)}_{\text{If transition, get } P(\text{Success})} + \underbrace{P(y_1^* = S|t)\mathbb{1}(d_1 = R)}_{\text{If reject, get } P(\text{Cutoff})}$$

Static Model

- **Goal:** Make Round 1 cutoff a probability bounded between 0 and 1

Round 2:

$$v_2(x, z, t, \epsilon_2) = \max_{d_2 \in \{A, R\}} u_2(x, z, t, d_2) + \epsilon_2(d_2), \text{ such that:}$$
$$u_2(x, z, t, d_2) = \underbrace{P(y = S|x, z)\mathbb{1}(d_2 = A)}_{\text{If accept, get } P(\text{Success})} + \underbrace{P(y_2^* = S|t)\mathbb{1}(d_2 = R)}_{\text{If reject, get } P(\text{Cutoff})}$$

Round 1:

$$v_1(x, t, \epsilon_1) = \max_{d_1 \in \{T, R\}} u_1(x, t, d_1) + \epsilon_1(d_1), \text{ such that:}$$
$$u_1(x, t, d_1) = \underbrace{P(y = S|x)\mathbb{1}(d_1 = T)}_{\text{If transition, get } P(\text{Success})} + \underbrace{P(y_1^* = S|t)\mathbb{1}(d_1 = R)}_{\text{If reject, get } P(\text{Cutoff})}$$

- $P(y = S|x)$ estimates inconsistent, but fitted values account for x 's effect on z

Portfolio Choice with Matriculation

- Accept subset of applicants with highest sum of success times matriculation probabilities subject to capacity constraint on expected number of matriculants
- For each applicant $n \in \{1, \dots, N\}$, make decision $d_n \in \{\text{Accept}, \text{Reject}\}$ given:

$$\max_{(d_1, \dots, d_N) \in \{A, R\}^N} \sum_{n=1}^N \underbrace{P(y_n = S | x_n, z_n)}_{\text{Success probability}} \underbrace{P(m_n = M | x_n, z_n)}_{\text{Matriculation probability}} \underbrace{\mathbb{1}(d_n = A)}_{\text{Acceptance}},$$

$$\text{such that: } \sum_{n=1}^N \underbrace{P(m_n = M | x_n, z_n)}_{\text{Matriculation probability}} \underbrace{\mathbb{1}(d_n = A)}_{\text{Acceptance}} \leq N_M,$$

where (x, z) = variables, $y \in \{\text{Success}, \text{Failure}\}$, $m \in \{\text{Matriculate}, \text{Decline}\}$,
 N = number of applicants, and N_M = maximum number of matriculants

Portfolio Choice with Matriculation

- Accept subset of applicants with highest sum of success times matriculation probabilities subject to capacity constraint on expected number of matriculants

$$\max_{(d_1, \dots, d_N) \in \{A, R\}^N} \sum_{n=1}^N \underbrace{P(y_n = S | x_n, z_n)}_{\text{Success probability}} \underbrace{P(m_n = M | x_n, z_n)}_{\text{Matriculation probability}} \underbrace{\mathbb{1}(d_n = A)}_{\text{Acceptance}},$$

such that: $\sum_{n=1}^N \underbrace{P(m_n = M | x_n, z_n)}_{\text{Matriculation probability}} \underbrace{\mathbb{1}(d_n = A)}_{\text{Acceptance}} \leq N_M$

- For large N , this problem reduces to cutoff rule problem on **success** probabilities
 - Likely matriculants more valuable, but also more expensive $\Rightarrow$ effects cancel
 - Upshot:** Matriculation probabilities only matter if there are dynamic effects

Waitlist Model

- Three-round model features waitlist and accounts for applicants' decisions
- Equations analogous to those in baseline two-round dynamic model
- Dynamic mechanism incentivizes giving early acceptances to likely matriculants

» Waitlist Equations

Waitlist Memory

- Respecify Round 3 cutoff $P(y_3^* = S|t)$, where $t = \text{year}$, as $P(y_3^* = S|\overline{m_{2A}})$
 - $\overline{m_{2A}}$ = average early accepted applicant's matriculation probability based on (x, z)
 - Enthusiasm variables can affect matriculation independently of success
 - $P(y_3^* = S|\overline{m_{2A}})$ increases in $\overline{m_{2A}}$ because larger $\overline{m_{2A}}$ means fewer openings
- What information available at start of Round 2 determines $\overline{m_{2A}}$?
 - For all transitioned applicants, $\ddot{m}_2$. $\ddot{m}_2$ is defined as $\overline{m_2}^t$ with m_2 excluded, where m_2 = applicant's own matriculation probability. Within t , low m_2 implies high $\ddot{m}_2$
 - Estimate $f_{\overline{m_{2A}}|\ddot{m}_2}$ on all transitioned applicants; slope parameter's expected sign is positive provided there is variation in $\overline{m_2}^t$ across years (e.g. due to Covid)

Waitlist Dynamics

Theorem 1 (Proof)

Success probability equal, an applicant's Round 2 acceptance probability is strictly increasing in their matriculation probability.

- Compared to high m_2 applicant, low m_2 applicant has high $\ddot{m}_2$, and therefore high $\bar{F}_{\overline{m_2A}|\ddot{m}_2}$, $\mathbb{E}[P(\text{Cutoff})_3]$, and $\mathbb{E}[v_3]$. This increases relative payoff of waitlisting them
- $\mathbb{E}[v_3]$ discounted so payoff from acceptance in Round 3 less than in Round 2
 - Captures chance of losing applicant to another university between rounds
 - If committee is more selective in Round 2, discount factor is closer to 1

★ **Upshot:** Accepting applicants who want to matriculate benefits the program

Outline

- 1 Reduced-Form Analysis
- 2 Structural Models
- 3 Structural Estimation**
- 4 Optimality Tests

Maximum Likelihood Estimation

$$\begin{aligned}
 \mathcal{L}_N^U(\theta) = & \prod_{n=1}^{N_T} \underbrace{f(z_n|x_n; \theta_F)}_{\text{Density of } z|x} \underbrace{P_{d_{1,n}}(\theta_T) P_{d_{2,n}}(\theta_A)^{\mathbb{1}(d_{2,n}=A)} (1 - P_{d_{2,n}}(\theta_A))^{\mathbb{1}(d_{2,n}=R)}}_{\text{Conditional choice probabilities}} \\
 & \underbrace{P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)} (1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)}}_{\text{Outcome probabilities}} \prod_{n=N_T+1}^N \underbrace{f(z_n|x_n; \theta_F)}_{\text{Density of } z|x} \underbrace{(1 - P_{d_{1,n}}(\theta_T))}_{\text{Conditional choice probability}}
 \end{aligned}$$

- In unrestricted likelihood $\mathcal{L}^U$, parameterize CCPs with flexible logit specifications
- In restricted likelihood $\mathcal{L}^R$, use model CCPs, which depend on structural parameters

Cutoff Probability Identification

Theorem 2 (Proof)

The maximum likelihood cutoff probability estimate is such that the number of acceptances N_A equals the expected N_A . Also, for any cutoff probability and N_A , the likelihood is highest when the committee accepts the best N_A applicants.

- Identify each year's cutoffs by how selective committee is that year
- While selectivity identifies cutoffs, sorting improves restricted likelihood
 - If committee engages in sorting, likelihood-ratio test less likely to reject
 - $LR = 2[\log(\hat{\mathcal{L}}^U) - \log(\hat{\mathcal{L}}^R)] \sim \chi_Q^2$, such that $Q = \dim(\theta^U) - \dim(\theta^R)$

• AME signs as expected $\Rightarrow$ results extend to three-round waitlist model

Outline

- 1 Reduced-Form Analysis
- 2 Structural Models
- 3 Structural Estimation
- 4 Optimality Tests

Likelihood-Ratio and Deviation Gains Tests

- **Likelihood-Ratio:** Determines whether model fits data generated by committee's decision rule, but not whether committee can do better by changing decision rule
- **Deviation Gains:** Suppose committee adopts model's decision rule. Will average success probability of acceptance/matriculation set increase, and if so, by how much?
 - Solve model with $\sigma = 0$ in CCPs, compute average yearly $P(\text{Success})$ of model's acceptance/matriculation set, and compare to that of actual decision rule's set
 - $\hat{\theta}_S^R$ may be biased to rationalize suboptimal behavior, so plug in $\hat{\theta}_S^U$
 - **Example:** If committee puts too little weight on *Advanced Math*, then its restricted success probability parameter estimate will be biased down

Deviation Gains Interpretation

- Suppose there are meaningfully large deviation gains. Then committee may have incorrect beliefs about which types of applicants are most likely to succeed
 - Matriculation rate of model's acceptance set may be less than that of actual decision rule's acceptance set, making estimated gains an upper bound
 - In waitlist counterfactual, compare success probabilities of matriculation sets by simulating accepted applicants' matriculation decisions after Rounds 2 and 3
- ★ **Robustness:** Given too few observations for holdout set and infeasibility of large k -fold cross-validation due to runtime, implement randomization test
 - Compute average success probabilities with perturbations of $\hat{\theta}_S^U$

Conclusion

- **Economic Problem:** Selecting best options under costly evaluation
- **Application:** Graduate admissions using synthetic data protocol to protect privacy
- **Contribution:** Use structural models to test optimality and quantify deviation gains
 - ① Economics admissions more data-driven than other social science programs
 - ② Tradeoff between marginal cost of reading file vs. quality of marginal acceptance can be used to calculate, in dollars, how much success is worth to committee
- **Future Research:** Two-sided matching model across multiple universities

Thank You!

 - **Working Paper:** arxiv, center for economic policy research, cepr, econpapers, national bureau of economic research, nber, research papers in economics, repec, social science research network, ssrn, working paper
 - **Publication:** Journal names from IDEAS/RePEc Aggregate Rankings for Journals
 - **Coding:** c/c++, eviews, fortran, java, jax, julia, latex, matlab, python, r, sas, stata, webscrape

A1: Inference vs. Prediction

- Hard to obtain consistent estimates due to omitted variables
 - **Example:** Don't observe effort (e.g. hours worked). Can bias coefficients upward if predictors correlated with effort and success are independent of effort
 - Existing literature also suffers from this problem, though BEMS (2022) parse recommendation letters for “grindstone terms” (e.g. depend*, diligen*)
- Research questions emphasize prediction over inference
 - Mullainathan & Spiess (2017) distinguish $\hat{\beta}$ vs. $\hat{y}$ problems
 - If GRE predicts success, committee should use it regardless of why
 - See Reduced-Form Summary for prediction-based methods

A1: Sample Selection

- Determinants of success conditional on applying vs. matriculating
- BEMS (2022) prove that if $P(\text{Success}|\text{Skill})$ is an S-curve, then $\hat{\beta}$ will be smaller for more selected samples. Consistent with empirical results
- If there aren't some types of outcomes data (e.g. grades, passing comps) for all applicants, or such data are too hard to obtain, use Heckman correction
 - Let $y_n^* = x_n\beta + u_n$, $d_n = \mathbb{1}(z_n\gamma + v_n > 0)$, and $y_n = d_n y_n^*$
 - **Step 1:** Run probit of d on z and compute inverse Mills $\hat{\lambda}_n = \frac{\phi(z_n\hat{\gamma})}{\Phi(z_n\hat{\gamma})}$
 - **Step 2:** Run OLS, probit, or ordered probit of y on $(x, \hat{\lambda})$ to get $\hat{\beta}$
 - **Instruments:** Enthusiasm score, average acceptance rate/quality

A1: Insufficiency of Comparing AMEs

- Cannot test optimality by comparing AMEs across regressions. Suppose:
 - Math skills have large positive effect on success, coding skills smaller positive effect
 - 25% of applicants have both skills, 25% math only, 25% coding only, 25% neither
 - Committee can accept half of applicants, and other half attend different university
- Optimizing committee accepts half with math and ignores coding
 - **Acceptance Regression:** $AME_{\text{Math}} = 1, AME_{\text{Coding}} = 0$
 - **Success Regression:** $1 > AME_{\text{Math}} > AME_{\text{Coding}} > 0$
 - Despite optimality, acceptance and success AMEs not equal across regressions
- **Upshot:** Relationship between AMEs must be interpreted through a model

A1: Wald Tests

- Test if admission and success AMEs are same across programs
 - **Example:** Does elite undergraduate university predict admission and/or success more or less for economics than for other programs?
 - **Data:** Simulated from reduced-form-calibrated data-generating parameters
- Can I test if acceptance AMEs equal success AMEs within programs?
 - Predictors of acceptance only (success only) may be overvalued (undervalued), provided committee wants to select based on a “success” model
 - **Problem:** Not a test if admissions decisions are optimal
 - Need structural model of admissions to conclude about optimality

A1: Logit Wald Test Across Programs

Assume $(Y^E \perp\!\!\!\perp Y^{NE})|X$. Let $P(Y_n^E = 1|x_n^E; \theta^E) = \frac{\exp(x_{n,0}^E \theta_0^E + x_{n,1}^E \theta_1^E)}{1 + \exp(x_{n,0}^E \theta_0^E + x_{n,1}^E \theta_1^E)}$,

and $P(Y_n^{NE} = 1|x_n^{NE}; \theta^{NE}) = \frac{\exp(x_{n,0}^{NE} \theta_0^{NE} + x_{n,1}^{NE} \theta_1^{NE})}{1 + \exp(x_{n,0}^{NE} \theta_0^{NE} + x_{n,1}^{NE} \theta_1^{NE})}$. Finally, let $N = N_E + N_{NE}$. Then:

$$\mathcal{L}_N^U(y|x; \theta) = \prod_{n=1}^{N_E} P(Y_n^E = 1|x_n^E; \theta^E)^{Y_n^E} [1 - P(Y_n^E = 1|x_n^E; \theta^E)]^{1-Y_n^E} \\ \prod_{n=1}^{N_{NE}} P(Y_n^{NE} = 1|x_n^{NE}; \theta^{NE})^{Y_n^{NE}} [1 - P(Y_n^{NE} = 1|x_n^{NE}; \theta^{NE})]^{1-Y_n^{NE}}.$$

- $Y \in \{1(\text{Accept}), 1(\text{Attend Program}), 1(\text{Complete Program}), 1(\text{Good Placement})\}$
- **Test:** Let $g(\hat{\theta}) = \frac{1}{N_E} \sum_{n=1}^{N_E} \hat{P}_n^E (1 - \hat{P}_n^E) \hat{\theta}_1^E - \frac{1}{N_{NE}} \sum_{n=1}^{N_{NE}} \hat{P}_n^{NE} (1 - \hat{P}_n^{NE}) \hat{\theta}_1^{NE}$. Then:
 $W = g(\hat{\theta})' [\nabla_{\theta} g(\hat{\theta}) \hat{V}(\hat{\theta}) \nabla_{\theta} g(\hat{\theta})']^{-1} g(\hat{\theta}) \sim \chi_Q^2$. Compare AMEs per Mood (2010)

A1: Linear Wald Test Across Programs

Assume $(Y^E \perp\!\!\!\perp Y^{NE})|X$, i.e. (Economics $\perp\!\!\!\perp$ Non-Economics) $|$ Predictors.

Let $f(y_n^E|x_n^E; \beta^E, \sigma_E^2) = \frac{1}{\sqrt{2\pi\sigma_E^2}} \exp\left[\frac{-1}{2\sigma_E^2}(y_n^E - x_{n,0}^E\beta_0^E - x_{n,1}^E\beta_1^E)^2\right]$, and

$f(y_n^{NE}|x_n^{NE}; \beta^{NE}, \sigma_{NE}^2) = \frac{1}{\sqrt{2\pi\sigma_{NE}^2}} \exp\left[\frac{-1}{2\sigma_{NE}^2}(y_n^{NE} - x_{n,0}^{NE}\beta_0^{NE} - x_{n,1}^{NE}\beta_1^{NE})^2\right]$. Then:

$$\mathcal{L}_N^U(y|x; \beta, \sigma^2) = \prod_{n=1}^{N_E} f(y_n^E|x_n^E; \beta^E, \sigma_E^2) \prod_{n=1}^{N_{NE}} f(y_n^{NE}|x_n^{NE}; \beta^{NE}, \sigma_{NE}^2).$$

- $Y \in \{\mathbb{1}(\text{Standardized Committee Score}), \mathbb{1}(\text{Standardized Placement Rank})\}$
- **Test:** Let $g(\hat{\beta}_1) = \hat{\beta}_1^E - \hat{\beta}_1^{NE}$. (Can also do likelihood-ratio test.)
Then $W = g(\hat{\beta}_1)'[\nabla_{\beta, \sigma^2} g(\hat{\beta}_1) \hat{V}(\hat{\beta}, \hat{\sigma}^2) \nabla_{\beta, \sigma^2} g(\hat{\beta}_1)']^{-1} g(\hat{\beta}_1) \sim \chi_Q^2$
- **Assumption:** Homoskedasticity (i.e. $\forall n, \sigma_n^2 = \sigma^2$)

A1: Additional Questions

- Are there different determinants of different types of success? (AKKLP 2007)
 - Need different skills at different stages in the program, such as grades vs. placement
 - For some programs, initial placement matters less than for economics
- Different determinants for international applicants? (KW 2000)
 - **Admission:** May have different preparation and/or interests
 - **Completion:** Depending on country, may have fewer outside options
 - **Placement:** May return to native country after graduation
- Different determinants over time? (2015 to 2023)
 - COVID-19 and other macro factors; changes in professions (e.g. more empirics)
 - For economics, increased importance of elite predocs and Fed RAs

A2.1: Portfolio Choice to Cutoff Rule (BEMS 2022)

Portfolio Choice Problem:

$$\max_{(d_1, \dots, d_N) \in \{A, R\}^N} \sum_{n=1}^N P(y_n = S | x_n, z_n) \mathbb{1}(d_n = A), \text{ such that: } \sum_{n=1}^N \mathbb{1}(d_n = A) \leq N_A$$

$$\mathcal{L}(d_1, \dots, d_N; \lambda) = \sum_{n=1}^N [P(y_n = S | x_n, z_n) - \lambda] \mathbb{1}(d_n = A) + \lambda N_A$$

Cutoff Rule Solution:

$$\forall n \in \{1, \dots, N\}, d_n(x_n, z_n | \lambda^*) = \begin{cases} A & \text{if } P(y_n = S | x_n, z_n) > \lambda^* \\ \{A, R\} & \text{if } P(y_n = S | x_n, z_n) = \lambda^* \\ R & \text{if } P(y_n = S | x_n, z_n) < \lambda^* \end{cases}$$

Upshot: λ^* is cutoff probability. Denote it hereafter as $P(y^* = S)$

- $P(y^* = S) \in [P(y_{N_A+1} = S | x_{N_A+1}, z_{N_A+1}), P(y_{N_A} = S | x_{N_A}, z_{N_A})]$

A2.1: Structural Models

- 1 **Year-Static Model:** Committee ranks applicants based on objective variables, reads files of applicants above Cutoff 1, re-ranks surviving applicants based on all variables, and accepts surviving applicants above Cutoff 2
- 2 **Year-Dynamic Model:** Committee forms expectation in Round 1 about applicants who survive to Round 2. Favors applicants with objective variables positively correlated with good subjective variables
- 3 **Waitlist-Hybrid/Dynamic Models:** After Round 1, committee accepts or waitlists applicants in Round 2. After accepted applicants matriculate or don't matriculate, committee accepts or rejects waitlisted applicants in Round 3. Favors likely matriculants in Round 2 to increase selectivity in Round 3

A2.1: Structural Description

- **Round 2:** If accept applicant, get success probability $P(y = S|x, z)$, where $\text{Success} = \mathbb{1}(\text{Complete Program})$ or $\mathbb{1}(\text{Good Placement})$. If reject applicant, get $P(y_2^* = S|t) = P(\text{Success})$ of year t 's marginal accepted applicant
- **Round 1:** If reject applicant, get $P(y_1^* = S|t) = P(\text{Success})$ of year t 's marginal transitioned applicant. Can be less or greater than $P(y_2^* = S|t)$ depending on value placed on committee's time vs. admitting a successful cohort
 - **Year-Static:** If transition applicant, get $P(y = S|x)$, or $P(\text{Success})$ unconditional on z . It may differ from $P(y = S|x, z)$, though it still accounts for x 's effect on z
 - **Year-Dynamic:** If transition applicant, get $\mathbb{E}[v_2(x, z, t, \epsilon_2)|x, t] =$ expected value of Round 2, where z is integrated out conditional on x via $F(z|x)$
 - **Year-Myopic:** In $\mathbb{E}[v_2(x, z, t, \epsilon_2)|x, t]$, replace $F(z|x)$ with $F(z)$

A2.1: Year-Static Parameterization

Unrestricted CCPs:

$$P_{d_1} = P(d_1 = T | x, t; \theta_T) = \frac{\exp(f_T(x, t)\theta_T)}{1 + \exp(f_T(x, t)\theta_T)}$$

$$P_{d_2} = P(d_2 = A | x, z, t; \theta_A) = \frac{\exp(f_A(x, z, t)\theta_A)}{1 + \exp(f_A(x, z, t)\theta_A)}$$

Success Probabilities:

$$P_{y_1} = P(y = S | x; \theta_{S_1}) = \frac{\exp(f_{S_1}(x)\theta_{S_1})}{1 + \exp(f_{S_1}(x)\theta_{S_1})}$$

$$P_{y_2} = P(y = S | x, z; \theta_{S_2}) = \frac{\exp(f_{S_2}(x, z)\theta_{S_2})}{1 + \exp(f_{S_2}(x, z)\theta_{S_2})}$$

Cutoff Probabilities:

$$P_{y_1^*} = P(y_1^* = S | t; \theta_{S_1^*}) = \frac{\exp(f_{S_1^*}(t)\theta_{S_1^*})}{1 + \exp(f_{S_1^*}(t)\theta_{S_1^*})}$$

$$P_{y_2^*} = P(y_2^* = S | t; \theta_{S_2^*}) = \frac{\exp(f_{S_2^*}(t)\theta_{S_2^*})}{1 + \exp(f_{S_2^*}(t)\theta_{S_2^*})}$$

A2.1: Year-Dynamic Parameterization

$$\begin{aligned}\mathbb{E}[v_2(x, z, t, \epsilon_2)|x, t] &= \int_{\tilde{z}} \sigma \log \left(\sum_{\tilde{d}_2 \in \{A, R\}} e^{u_2(x, \tilde{z}, t, \tilde{d}_2)/\sigma} \right) dF(\tilde{z}|x) \\ &= \int_{\tilde{z}_1} \cdots \int_{\tilde{z}_J} \left[\cdot \right] dF_1(\tilde{z}_1|\tilde{z}_2, \dots, \tilde{z}_J, x) \cdots dF_J(\tilde{z}_J|x)\end{aligned}$$

- **Continuous:** $f_{z|x}(z_j|x; \beta_{F_{z|x,j}}, \sigma_{F_{z|x,j}}^2) = \frac{1}{\sqrt{2\pi\sigma_{F_{z|x,j}}^2}} \exp \left[\frac{-1}{2\sigma_{F_{z|x,j}}^2} (z_j - g(x)\beta_{F_{z|x,j}})^2 \right]$
- **Binary:** $P(z_j = 1|x; \theta_{F_{z|x,j}}) = \frac{\exp(g(x)\theta_{F_{z|x,j}})}{1 + \exp(g(x)\theta_{F_{z|x,j}})}$
- **Multinomial:** $P(z_j = (k \neq K)|x; \theta_{F_{z|x,j}^k}) = \frac{\exp(g(x)\theta_{F_{z|x,j}^k})}{1 + \sum_{\ell=1}^{K-1} \exp(g(x)\theta_{F_{z|x,j}^\ell})}$

A2.1: Year-Static Likelihood

$$\mathcal{L}_N^U(\theta) = \prod_{n=1}^{N_T} P_{d_{1,n}}(\theta_T) P_{d_{2,n}}(\theta_A)^{\mathbb{1}(d_{2,n}=A)} (1 - P_{d_{2,n}}(\theta_A))^{\mathbb{1}(d_{2,n}=R)} \left[P_{y_{1,n}}(\theta_{S_1}) P_{y_{2,n}}(\theta_{S_2}) \right]^{\mathbb{1}(y_n=S)} \\ \left[(1 - P_{y_{1,n}}(\theta_{S_1})) (1 - P_{y_{2,n}}(\theta_{S_2})) \right]^{\mathbb{1}(y_n=F)} \prod_{n=N_T+1}^N (1 - P_{d_{1,n}}(\theta_T)) P_{y_{1,n}}(\theta_{S_1})^{\mathbb{1}(y_n=S)} (1 - P_{y_{1,n}}(\theta_{S_1}))^{\mathbb{1}(y_n=F)}$$

- **Problem:** I don't observe success for recent years
 - **Solution:** Separate block for recent years without success subblocks
 - **Assumption:** Older years representative of recent years
- If years are similar, can make $(\theta_{S_1^*}, \theta_{S_2^*})$ in $\mathcal{L}^R$ intercept only

A2.1: Year-Dynamic Heckman-Corrected Likelihood

$$\mathcal{L}_N^U(\theta) = \prod_{n=1}^{N_T} \Phi(x_n, t_n; \theta_H) f(z_n | x_n, \frac{\phi(x_n, t_n; \theta_H)}{\Phi(x_n, t_n; \theta_H)}; \theta_F) P_{d_{1,n}}(\theta_T) P_{d_{2,n}}(\theta_A)^{\mathbb{1}(d_{2,n}=A)} (1 - P_{d_{2,n}}(\theta_A))^{\mathbb{1}(d_{2,n}=R)}$$
$$P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)} (1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)} \prod_{n=N_T+1}^N (1 - \Phi(x_n, t_n; \theta_H)) (1 - P_{d_{1,n}}(\theta_T))$$

- I may not observe z for applicants who didn't survive Round 1
- Estimate Heckman (1979)-corrected full-information likelihood
- **Heckman Instrument:** Year t affects d_1 but not z

A2.1: Conditional Independence Assumption

- Should I assume success is independent of admission conditional on predictors?
 - This university aside, if you don't get into anywhere good, you're unlikely to succeed
 - Can bias $\hat{\theta}_S$ upward since without loss of generality, a low GRE is correlated with not getting in anywhere good, which itself prevents you from succeeding
- So should I replace $P(y = S|x; \theta_S)$ with $P(y = S|d, x; \theta_S)$?
 - **Problem 1:** If I condition y on $d = \mathbb{1}(\text{Accept})$, I would be “logistically regressing” d on y on d in restricted likelihood, which will fail
 - **Problem 2:** Because d is a function of x , even conditioning y on x and $d = \mathbb{1}(\text{Attend Program})$ will “collapse” $\hat{\theta}_S$ (except for $\hat{\theta}_S^d$)
 - ★ **Example:** In AKKLP (2007), quantitative GRE predicts course grades but not when Committee Score is included; coefficient even goes negative for Metrics Grade
 - **Problem 3:** Committee doesn't know *ex-ante* whether d will be 1 or 0

A2.1: Empirical Considerations

- **Selection Effects:** Track success for all applicants, including non-matriculants
 - In selected samples, success parameters are biased down (e.g. quantitative GRE)
- **Potential Outcomes:** Track which graduate program all applicants attended, and add expected program ranking conditional on (x, z) as control function
 - If a variable only predicts success by helping applicant get into elite graduate program, then committee should not use that variable to rank applicants
- **Unobservables:** I may not observe all information that committee observes
 - **Example:** Recommendation letter has nuances that algorithms can't detect
 - Include subjective committee score in z as a proxy for this information

A2.1: Cutoff Rule with Matriculation

Portfolio Choice Problem:

$$\max_{\delta \in \{\delta | \delta: \mathbb{R}^K \rightarrow [0,1]\}} \int_{(x,z) \in \mathbb{R}^K} P(y = S|x, z) P(m = M|x, z) \delta(x, z) dF(x, z),$$

$$\text{such that: } \int_{(x,z) \in \mathbb{R}^K} P(m = M|x, z) \delta(x, z) dF(x, z) \leq N_M$$

$$\mathcal{L}(\delta; \lambda) = \int_{(x,z) \in \mathbb{R}^K} [P(y = S|x, z) - \lambda] P(m = M|x, z) \delta(x, z) dF(x, z) + \lambda N_M$$

Cutoff Rule Solution:

$$\forall (x, z) \in \mathbb{R}^K, \delta(x, z | \lambda^*) = \begin{cases} 1 & \text{if } P(y = S|x, z) > \lambda^* \\ [0, 1] & \text{if } P(y = S|x, z) = \lambda^* \\ 0 & \text{if } P(y = S|x, z) < \lambda^* \end{cases}$$

Upshot: Point-identified cutoff probability λ^* is with respect to success probabilities

A2.1: Waitlist Model 1

Round 3:

$$v_3(x, z, \overline{m}_{2A}, \epsilon_3) = \max_{d_3 \in \{A, R\}} u_3(x, z, \overline{m}_{2A}, d_3) + \epsilon_3(d_3), \text{ such that:}$$

$$u_3(x, z, \overline{m}_{2A}, d_3) = \underbrace{P(y = S | x, z) \mathbb{1}(d_3 = A)}_{\text{If accept, get } P(\text{Success})} + \underbrace{P(y_3^* = S | \overline{m}_{2A}) \mathbb{1}(d_3 = R)}_{\text{If reject, get } P(\text{Cutoff})}$$

Round 2:

$$v_2(x, z, \ddot{m}_2, \epsilon_2) = \max_{d_2 \in \{A, W\}} u_2(x, z, \ddot{m}_2, d_2) + \epsilon_2(d_2), \text{ such that:}$$

$$u_2(x, z, \ddot{m}_2, d_2) = \underbrace{P(y = S | x, z) \mathbb{1}(d_2 = A)}_{\text{If accept, get } P(\text{Success})} + \underbrace{\beta \mathbb{E}[v_3(x, z, \overline{m}_{2A}, \epsilon_3) | x, z, \ddot{m}_2] \mathbb{1}(d_2 = W)}_{\text{If waitlist, get discounted } \mathbb{E}[\text{Social Surplus}]}, \text{ such that:}$$

$$\mathbb{E}[v_3(x, z, \overline{m}_{2A}, \epsilon_3) | x, z, \ddot{m}_2] = \int_{\widetilde{\overline{m}_{2A}}} \sigma \log \left(\sum_{\widetilde{d}_3 \in \{A, R\}} e^{u_3(x, z, \widetilde{\overline{m}_{2A}}, \widetilde{d}_3) / \sigma} \right) dF_{\overline{m}_{2A} | \ddot{m}_2}(\widetilde{\overline{m}_{2A}} | \ddot{m}_2)$$

A2.1: Waitlist Model 2

Round 1:

$$v_1(x, t, \epsilon_1) = \max_{d_1 \in \{T, R\}} u_1(x, t, d_1) + \epsilon_1(d_1), \text{ such that:}$$

$$u_1(x, t, d_1) = \underbrace{\mathbb{E}[v_2(x, z, \ddot{m}_2, \epsilon_2)|x] \mathbb{1}(d_1 = T)}_{\text{If transition, get } \mathbb{E}[\text{Social Surplus}]} + \underbrace{L(y_1^* = S|t) \mathbb{1}(d_1 = R)}_{\text{If reject, get } L(\text{Cutoff})}, \text{ such that:}$$

$$\mathbb{E}[v_2(x, z, \ddot{m}_2, \epsilon_2)|x] = \int_{\tilde{z}} \int_{\tilde{\ddot{m}}_2} \sigma \log \left(\sum_{\tilde{d}_2 \in \{A, R\}} e^{u_2(x, \tilde{z}, \tilde{\ddot{m}}_2, \tilde{d}_2)/\sigma} \right) dF_{\ddot{m}_2|x, z}(\tilde{\ddot{m}}_2|x, \tilde{z}) dF_{z|x}(\tilde{z}|x)$$

Conditional Choice Probabilities:

$$P(d_r|\text{states}) = \frac{\exp(u_r(\text{states}, d_r)/\sigma)}{\sum_{\tilde{d}_r \in D_r} \exp(u_r(\text{states}, \tilde{d}_r)/\sigma)}$$

A2.1: Waitlist Model 2

Round 1 (Hybrid):

$$v_1(x, t, \epsilon_1) = \max_{d_1 \in \{T, R\}} u_1(x, t, d_1) + \epsilon_1(d_1), \text{ such that:}$$

$$u_1(x, t, d_1) = \underbrace{P(y = S|x)\mathbb{1}(d_1 = T)}_{\text{If transition, get } P(\text{Success})} + \underbrace{P(y_1^* = S|t)\mathbb{1}(d_1 = R)}_{\text{If reject, get } P(\text{Cutoff})}$$

Conditional Choice Probabilities:

$$P(d_r | \text{states}) = \frac{\exp(u_r(\text{states}, d_r)/\sigma)}{\sum_{\tilde{d}_r \in D_r} \exp(u_r(\text{states}, \tilde{d}_r)/\sigma)}$$

A2.1: Waitlist-Dynamic Parameterization 1

Unrestricted CCPs:

$$P_{d_1} = P(d_1 = T | x, t; \theta_T) = \frac{\exp(f_T(x, t)\theta_T)}{1 + \exp(f_T(x, t)\theta_T)}$$

$$P_{d_2} = P(d_2 = A | x, z, \ddot{m}_2; \theta_{A_2}) = \frac{\exp(f_{A_2}(x, z, \ddot{m}_2)\theta_{A_2})}{1 + \exp(f_{A_2}(x, z, \ddot{m}_2)\theta_{A_2})}$$

$$P_{d_3} = P(d_3 = A | x, z, \overline{m_{2A}}; \theta_{A_3}) = \frac{\exp(f_{A_3}(x, z, \overline{m_{2A}})\theta_{A_3})}{1 + \exp(f_{A_3}(x, z, \overline{m_{2A}})\theta_{A_3})}$$

Success Probability:

$$P_y = P(y = S | x, z; \theta_S) = \frac{\exp(f_S(x, z)\theta_S)}{1 + \exp(f_S(x, z)\theta_S)}$$

Cutoff Level/Probability:

$$L_{y_1^*} = L(y_1^* = S | t; \theta_{S_1^*}) = \exp(f_{S_1^*}(t)\theta_{S_1^*})$$

$$P_{y_3^*} = P(y_3^* = S | \overline{m_{2A}}; \theta_{S_3^*}) = \frac{\exp(f_{S_3^*}(\overline{m_{2A}})\theta_{S_3^*})}{1 + \exp(f_{S_3^*}(\overline{m_{2A}})\theta_{S_3^*})}$$

A2.1: Waitlist-Dynamic Parameterization 2

★ Assume z and $\ddot{m}_2$ are conditionally independent:

$$\begin{aligned}\mathbb{E}[v_2(x, z, \ddot{m}_2, \epsilon_2)|x] &= \int_{\tilde{z}} \int_{\tilde{\ddot{m}}_2} \sigma \log \left(\sum_{\tilde{d}_2 \in \{A, R\}} e^{u_2(x, \tilde{z}, \tilde{\ddot{m}}_2, \tilde{d}_2)/\sigma} \right) dF_{\ddot{m}_2|x, z}(\tilde{\ddot{m}}_2|x, \tilde{z}) dF_{z|x}(\tilde{z}|x) \\ &= \int_{\tilde{z}_1} \cdots \int_{\tilde{z}_{J_z}} \int_{\tilde{\ddot{m}}_2} \left[\cdot \right] dF_{\ddot{m}_2|x, z}(\tilde{\ddot{m}}_2|x, \tilde{z}) dF_{z|x, 1}(\tilde{z}_1|\tilde{z}_2, \dots, \tilde{z}_{J_z}, x) \cdots dF_{z|x, J_z}(\tilde{z}_{J_z}|x)\end{aligned}$$

$$\mathbb{E}[v_3(x, z, \overline{m_{2A}}, \epsilon_3)|x, z, \ddot{m}_2] = \int_{\overline{\ddot{m}_{2A}}} \sigma \log \left(\sum_{\tilde{d}_3 \in \{A, R\}} e^{u_3(x, z, \overline{\ddot{m}_{2A}}, \tilde{d}_3)/\sigma} \right) dF_{\overline{m_{2A}}|\ddot{m}_2}(\overline{\ddot{m}_{2A}}|\ddot{m}_2)$$

- **Continuous:** $f_{z|x}(z_j|x; \beta_{F_{z|x,j}}, \sigma_{F_{z|x,j}}^2) = \frac{1}{\sqrt{2\pi\sigma_{F_{z|x,j}}^2}} \exp \left[\frac{-1}{2\sigma_{F_{z|x,j}}^2} (z_j - g(x)\beta_{F_{z|x,j}})^2 \right]$
- **Binary:** $P(z_j = 1|x; \theta_{F_{z|x,j}}) = \frac{\exp(g(x)\theta_{F_{z|x,j}})}{1 + \exp(g(x)\theta_{F_{z|x,j}})}$
- **Multinomial:** $P(z_j = (k \neq K)|x; \theta_{F_{z|x,j}^k}) = \frac{\exp(g(x)\theta_{F_{z|x,j}^k})}{1 + \sum_{\ell=1}^{K-1} \exp(g(x)\theta_{F_{z|x,j}^\ell})}$

A2.1: Waitlist-Dynamic Likelihood

$$\begin{aligned}
 \mathcal{L}_{N_1}^U(\theta) = & \prod_{n=1}^{N_3} f_{z|x}(z_n|x_n; \theta_{F_{z|x}}) f_{\ddot{m}_2|x,z}(\ddot{m}_{2,n}|x_n, z_n; \theta_{F_{\ddot{m}_2|x,z}}) f_{\overline{m_{2A}}|\ddot{m}_2}(\overline{m_{2A,n}}|\ddot{m}_{2,n}; \theta_{F_{\overline{m_{2A}}|\ddot{m}_2}}) \\
 & P_{d_{1,n}}(\theta_T)(1 - P_{d_{2,n}}(\theta_{A_2}))P_{d_{3,n}}(\theta_{A_3})^{\mathbb{1}(d_{3,n}=A)}(1 - P_{d_{3,n}}(\theta_{A_3}))^{\mathbb{1}(d_{3,n}=R)}P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)}(1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)} \\
 & \prod_{n=N_3+1}^{N_2} f_{z|x}(z_n|x_n; \theta_{F_{z|x}}) f_{\ddot{m}_2|x,z}(\ddot{m}_{2,n}|x_n, z_n; \theta_{F_{\ddot{m}_2|x,z}}) f_{\overline{m_{2A}}|\ddot{m}_2}(\overline{m_{2A,n}}|\ddot{m}_{2,n}; \theta_{F_{\overline{m_{2A}}|\ddot{m}_2}}) \\
 & P_{d_{1,n}}(\theta_T)P_{d_{2,n}}(\theta_{A_2})P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)}(1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)} \\
 & \prod_{n=N_2+1}^{N_1} f_{z|x}(z_n|x_n; \theta_{F_{z|x}}) f_{\ddot{m}_2|x,z}(\ddot{m}_{2,n}|x_n, z_n; \theta_{F_{\ddot{m}_2|x,z}})(1 - P_{d_{1,n}}(\theta_T))
 \end{aligned}$$

- For $\mathcal{L}_R$, use (θ_F^U, θ_S^U) as initial guess of (θ_F^R, θ_S^R)
- Heckman corrections may be necessary, such as for $f_{z|x}$ and $f_{\ddot{m}_2|x,z}$

A2.1: Full Waitlist Model 1

Round 3:

$$v_3(x, z, \overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3}, \epsilon_3) = \max_{d_3 \in \{A, R\}} u_3(x, z, \overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3}, d_3) + \epsilon_3(d_3), \text{ such that:}$$

$$u_3(x, z, \overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3}, d_3) = P(y = S|x, z)\mathbb{1}(d_3 = A) + P(y_3^* = S|\overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3})\mathbb{1}(d_3 = R)$$

Round 2:

$$v_2(x, z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2}, \epsilon_2) = \max_{d_2 \in \{A, W\}} u_2(x, z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2}, d_2) + \epsilon_2(d_2), \text{ such that:}$$

$$u_2(x, z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2}, d_2) = P(y = S|x, z)\mathbb{1}(d_2 = A) + \beta \mathbb{E}[v_3(x, z, \overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3}, \epsilon_3)|x, z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2}]\mathbb{1}(d_2 = W), \text{ such that:}$$

$$\begin{aligned} & \mathbb{E}[v_3(x, z, \overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3}, \epsilon_3)|x, z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2}] = \\ & \int_{\widetilde{\overline{m_3}}} \int_{\widetilde{\overline{q_3}}} \int_{\widetilde{n_3}} \int_{\widetilde{\overline{m_{2A}}}} \sigma \log \left(\sum_{\tilde{d}_3 \in \{A, R\}} e^{u_3(x, z, \widetilde{\overline{m_{2A}}}, \tilde{n}_3, \tilde{\overline{q_3}}, \tilde{\overline{m_3}}, \tilde{d}_3) / \sigma} \right) dF_{\overline{m_{2A}}|\ddot{m}_2}(\widetilde{\overline{m_{2A}}}|\ddot{m}_2) dF_{n_3|n_2}(\tilde{n}_3|n_2) dF_{\overline{q_3}|\overline{q_2}}(\tilde{\overline{q_3}}|\overline{q_2}) dF_{\overline{m_3}|\overline{m_2}}(\tilde{\overline{m_3}}|\overline{m_2}) \end{aligned}$$

A2.1: Full Waitlist Model 2

Round 1:

$$v_1(x, t, n_1, \overline{q_1}, \overline{m_1}, \epsilon_1) = \max_{d_1 \in \{T, R\}} u_1(x, t, n_1, \overline{q_1}, \overline{m_1}, d_1) + \epsilon_1(d_1), \text{ such that:}$$

• **Hybrid:** $u_1(x, t, d_1) = P(y = S|x)\mathbb{1}(d_1 = T) + P(y_1^* = S|t)\mathbb{1}(d_1 = R)$

• **Dynamic:**

$$u_1(x, t, n_1, \overline{q_1}, \overline{m_1}, d_1) = \mathbb{E}[v_2(x, z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2}, \epsilon_2)|x, n_1, \overline{q_1}, \overline{m_1}]\mathbb{1}(d_1 = T) + L(y_1^* = S|t)\mathbb{1}(d_1 = R), \text{ such that:}$$

$$\mathbb{E}[v_2(x, z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2}, \epsilon_2)|x, n_1, \overline{q_1}, \overline{m_1}] =$$

$$\int_{\widetilde{\overline{m_2}}} \int_{\widetilde{\overline{q_2}}} \int_{\widetilde{n_2}} \int_{\widetilde{z}} \int_{\widetilde{\ddot{m}_2}} \sigma \log \left(\sum_{\widetilde{d_2} \in \{A, R\}} e^{u_2(x, \widetilde{z}, \widetilde{\ddot{m}_2}, \widetilde{n_2}, \widetilde{\overline{q_2}}, \widetilde{\overline{m_2}}, \widetilde{d_2})/\sigma} \right) dF_{\ddot{m}_2|x, z}(\ddot{m}_2|x, \widetilde{z}) dF_{z|x}(\widetilde{z}|x) dF_{n_2|n_1}(\widetilde{n_2}|n_1) dF_{\overline{q_2}|\overline{q_1}}(\widetilde{\overline{q_2}}|\overline{q_1}) dF_{\overline{m_2}|\overline{m_1}}(\widetilde{\overline{m_2}}|\overline{m_1})$$

Conditional Choice Probabilities:

$$P(d_r|\text{states}) = \frac{\exp(u_r(\text{states}, d_r)/\sigma)}{\sum_{\widetilde{d_r} \in D_r} \exp(u_r(\text{states}, \widetilde{d_r})/\sigma)}$$

A2.1: Full Waitlist-Dynamic Parameterization 1

Unrestricted CCPs:

$$P_{d_1} = P(d_1 = T | x, t, n_1, \overline{q_1}, \overline{m_1}; \theta_T) = \frac{\exp(f_T(x, t, n_1, \overline{q_1}, \overline{m_1})\theta_T)}{1 + \exp(f_T(x, t, n_1, \overline{q_1}, \overline{m_1})\theta_T)}$$

$$P_{d_2} = P(d_2 = A | x, z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2}; \theta_{A_2}) = \frac{\exp(f_{A_2}(x, z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2})\theta_{A_2})}{1 + \exp(f_{A_2}(x, z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2})\theta_{A_2})}$$

$$P_{d_3} = P(d_3 = A | x, z, \overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3}; \theta_{A_3}) = \frac{\exp(f_{A_3}(x, z, \overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3})\theta_{A_3})}{1 + \exp(f_{A_3}(x, z, \overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3})\theta_{A_3})}$$

Success Probability:

$$P_y = P(y = S | x, z; \theta_S) = \frac{\exp(f_S(x, z)\theta_S)}{1 + \exp(f_S(x, z)\theta_S)}$$

Cutoff Levels/Probabilities:

$$L_{y_1^*} = L(y_1^* = S | t; \theta_{S_1^*}) = \exp(f_{S_1^*}(t)\theta_{S_1^*})$$

$$P_{y_3^*} = P(y_3^* = S | \overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3}; \theta_{S_3^*}) = \frac{\exp(f_{S_3^*}(\overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3})\theta_{S_3^*})}{1 + \exp(f_{S_3^*}(\overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3})\theta_{S_3^*})}$$

A2.1: Full Waitlist-Dynamic Parameterization 2

★ Assume $(z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2})$ and $(\overline{m_{2A}}, n_3, \overline{q_3}, \overline{m_3})$ are mutually conditionally independent:

$$\mathbb{E}[v_2(x, z, \ddot{m}_2, n_2, \overline{q_2}, \overline{m_2}, \epsilon_2) | x, n_1, \overline{q_1}, \overline{m_1}] = \int_{\widetilde{\overline{m_2}}} \int_{\widetilde{\overline{q_2}}} \int_{\widetilde{n_2}} \int_{\widetilde{z}} \int_{\widetilde{\ddot{m}_2}} \sigma \log \left(\sum_{\widetilde{d_2} \in \{A, R\}} e^{u_2(x, \widetilde{z}, \widetilde{\ddot{m}_2}, \widetilde{n_2}, \widetilde{\overline{q_2}}, \widetilde{\overline{m_2}}, \widetilde{d_2}) / \sigma} \right)$$

- **Continuous:** $f_{z|x}(z_j|x; \beta_{F_{z|x,j}}, \sigma_{F_{z|x,j}}^2) = \frac{1}{\sqrt{2\pi\sigma_{F_{z|x,j}}^2}} \exp \left[\frac{-1}{2\sigma_{F_{z|x,j}}^2} (z_j - g(x)\beta_{F_{z|x,j}})^2 \right]$

- **Binary:** $P(z_j = 1|x; \theta_{F_{z|x,j}}) = \frac{\exp(g(x)\theta_{F_{z|x,j}})}{1 + \exp(g(x)\theta_{F_{z|x,j}})}$

- **Multinomial:** $P(z_j = (k \neq K)|x; \theta_{F_{z|x,j}^k}) = \frac{\exp(g(x)\theta_{F_{z|x,j}^k})}{1 + \sum_{\ell=1}^{K-1} \exp(g(x)\theta_{F_{z|x,j}^\ell})}$

A2.1: Full Waitlist-Dynamic Likelihood

$$\begin{aligned}
 \mathcal{L}_{N_1}^U(\theta) = & \prod_{n=1}^{N_3} f_{z|x}(z_n|x_n; \theta_{F_{z|x}}) f_{\ddot{m}_2|x,z}(\ddot{m}_{2,n}|x_n, z_n; \theta_{F_{\ddot{m}_2|x,z}}) f_{n_2|n_1}(n_{2,n}|n_{1,n}; \theta_{F_{n_2|n_1}}) f_{\overline{q_2}|\overline{q_1}}(\overline{q_{2,n}}|\overline{q_{1,n}}; \theta_{F_{\overline{q_2}|\overline{q_1}}}) f_{\overline{m_2}|\overline{m_1}}(\overline{m_{2,n}}|\overline{m_{1,n}}; \theta_{F_{\overline{m_2}|\overline{m_1}}}) \\
 & f_{\overline{m_{2A}}|\overline{m_2}}(\overline{m_{2A,n}}|\overline{m_{2,n}}; \theta_{F_{\overline{m_{2A}}|\overline{m_2}}}) f_{n_3|n_2}(n_{3,n}|n_{2,n}; \theta_{F_{n_3|n_2}}) f_{\overline{q_3}|\overline{q_2}}(\overline{q_{3,n}}|\overline{q_{2,n}}; \theta_{F_{\overline{q_3}|\overline{q_2}}}) f_{\overline{m_3}|\overline{m_2}}(\overline{m_{3,n}}|\overline{m_{2,n}}; \theta_{F_{\overline{m_3}|\overline{m_2}}}) \\
 & P_{d_{1,n}}(\theta_T)(1 - P_{d_{2,n}}(\theta_{A_2}))P_{d_{3,n}}(\theta_{A_3})^{\mathbb{1}(d_{3,n}=A)}(1 - P_{d_{3,n}}(\theta_{A_3}))^{\mathbb{1}(d_{3,n}=R)}P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)}(1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)} \\
 \prod_{n=N_3+1}^{N_2} & f_{z|x}(z_n|x_n; \theta_{F_{z|x}}) f_{\ddot{m}_2|x,z}(\ddot{m}_{2,n}|x_n, z_n; \theta_{F_{\ddot{m}_2|x,z}}) f_{n_2|n_1}(n_{2,n}|n_{1,n}; \theta_{F_{n_2|n_1}}) f_{\overline{q_2}|\overline{q_1}}(\overline{q_{2,n}}|\overline{q_{1,n}}; \theta_{F_{\overline{q_2}|\overline{q_1}}}) f_{\overline{m_2}|\overline{m_1}}(\overline{m_{2,n}}|\overline{m_{1,n}}; \theta_{F_{\overline{m_2}|\overline{m_1}}}) \\
 & f_{\overline{m_{2A}}|\overline{m_2}}(\overline{m_{2A,n}}|\overline{m_{2,n}}; \theta_{F_{\overline{m_{2A}}|\overline{m_2}}}) f_{n_3|n_2}(n_{3,n}|n_{2,n}; \theta_{F_{n_3|n_2}}) f_{\overline{q_3}|\overline{q_2}}(\overline{q_{3,n}}|\overline{q_{2,n}}; \theta_{F_{\overline{q_3}|\overline{q_2}}}) f_{\overline{m_3}|\overline{m_2}}(\overline{m_{3,n}}|\overline{m_{2,n}}; \theta_{F_{\overline{m_3}|\overline{m_2}}}) \\
 & P_{d_{1,n}}(\theta_T)P_{d_{2,n}}(\theta_{A_2})P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)}(1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)} \prod_{n=N_2+1}^{N_1} f_{z|x}(z_n|x_n; \theta_{F_{z|x}}) f_{\ddot{m}_2|x,z}(\ddot{m}_{2,n}|x_n, z_n; \theta_{F_{\ddot{m}_2|x,z}}) \\
 & f_{n_2|n_1}(n_{2,n}|n_{1,n}; \theta_{F_{n_2|n_1}}) f_{\overline{q_2}|\overline{q_1}}(\overline{q_{2,n}}|\overline{q_{1,n}}; \theta_{F_{\overline{q_2}|\overline{q_1}}}) f_{\overline{m_2}|\overline{m_1}}(\overline{m_{2,n}}|\overline{m_{1,n}}; \theta_{F_{\overline{m_2}|\overline{m_1}}})(1 - P_{d_{1,n}}(\theta_T))
 \end{aligned}$$

- For $\mathcal{L}^R$ and $\mathcal{L}^U$, estimate θ_S^U with 1st-stage likelihood to get $\bar{q}$ = current year's $\overline{P_{y_n}}$:
 $\mathcal{L}_{N_2}^P(\theta_S) = \prod_{n=1}^{N_2} P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)}(1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)}$

A2.1: Waitlist Notes: Memory and Dynamics

- **Memory:** Need at least 5 years of data to identify all parameters
 - For simplicity with simulated data, suppose committee provides m_2 . But to estimate m_2 with actual data, estimate matriculation parameters in first-stage likelihood
- **Dynamics:** What if committee doesn't think dynamically?
 - If $\ddot{m}_2$ increasing increases $\bar{F}_{\overline{m_{2A}}|\ddot{m}_2}$, which increases $\mathbb{E}[P(\text{Cutoff})_3]$, then it should
 - Don't need success data for all years to identify these two effects
- **Over/Undershooting:** Committee may wish to avoid both
 - To Round 3's $P(\text{Cutoff})$, add target cohort size minus number of early matriculants
 - Penalty parameter may be unidentifiable, so may have to calibrate it

A2.1: Optimality Tests Notes

- ❶ **Likelihood-Ratio:** Restricted model not nested in unrestricted model (Vuong 1989)
 - **Program Fit:** Does model fit program's behavior?
 - $d_1 = \mathbb{1}(\text{Transition})$, $d_2 = \mathbb{1}(\text{Accept})$
 - If not, could program be behaving suboptimally (Simon 1956)?
 - **Profession Fit:** Does model fit profession's behavior?
 - $d_2 = \mathbb{1}(\text{AttendProgram})$ but d_1 unobservable, so must estimate one-stage model
- ❷ **Deviation Gains:** Adjust θ_{S^*} so transition and acceptance rates are unchanged
 - **Year-Static:** Rank all applicants by $P(y = S|x)$, set $\theta_{S_1^*}$ to match transition rate, rank survivors by $P(S|x, z)$, and set $\theta_{S_2^*}$ to match acceptance rate
 - **Year-Dynamic:** Use MSM to estimate new $(\theta_{S_1^*}, \theta_{S_2^*})$; moments are each year's transition and acceptance rates. But counterfactual does not require $(\hat{\theta}_{S_1^*}, \hat{\theta}_{S_2^*})$

A2.1: How Deviation Gains Test Works

- 1 Write Bellman equations for committee's optimization problem
- 2 Estimate parameters. Rationality assumption distorts estimates
- 3 Re-estimate parameters without rationality, and use to solve model
- 4 Compare selections from model's decision rule to actual decision rule
- 5 To prevent overfitting, use perturbations of estimates for comparison

Non-Optimizing Committee

Optimizing Committee

A2.1: Deviation Gains Algorithm 1

Year-Static/Dynamic/Myopic:

- 1 Rank applicants in each year by $P(y = S|x)$ for static, or $\mathbb{E}[v_2(x, z, \epsilon_2)|x]$ for dynamic and myopic. Transition top N_T applicants, and reject the rest
- 2 Rank surviving applicants by $P(y = S|x, z)$, and accept top N_A survivors. Compute $\overline{P(y = S|x, z)}$ of acceptance set, and compare to committee's set

» Deviation Gains Interpretation

A2.1: Deviation Gains Algorithm 2

Waitlist-Hybrid/Dynamic:

- 1 Rank applicants in each year by $P(y = S|x)$ for hybrid, or $\mathbb{E}[v_2(x, z, \ddot{m}_2, \epsilon_2)|x]$ for dynamic. Transition top N_T applicants, and reject the rest
- 2 Rank surviving applicants by $P(y = S|x, z) - \beta \mathbb{E}[v_3(x, z, \overline{m}_{2A}, \epsilon_3)|x, z, \ddot{m}_2]$. Accept top N_{2A} survivors, and waitlist the rest
- 3 Rank early acceptances by matriculation score m . All early acceptances with m at least as high as committee's marginal early matriculant matriculate
- 4 Rank waitlisted applicants by $P(y = S|x, z)$. Increase/decrease N_{3A} to N'_{3A} depending on how many spots remain relative to committee
- 5 Rank late acceptances by m . Top ones matriculate until cohort is filled. Compute $P(y = S|x, z)$ of matriculation set, and compare to committee's set

A2.1: Randomization Tests 1

Theorem 3 (Proof)

Let d^R be the model's decision rule, and d^U the actual decision rule. By optimality:

$$\begin{aligned} \frac{1}{N_A} \sum_{n=1}^N P(y_n = S | x_n, z_n; \hat{\theta}_S^U) \mathbb{1} \{ d_{1,n}[P_{y_n}(\hat{\theta}^U)] = T, d_{2,n}^R[P_{y_n}(\hat{\theta}_S^U)] = A \} \\ \geq \frac{1}{N_A} \sum_{n=1}^N P(y_n = S | x_n, z_n; \hat{\theta}_S^U) \mathbb{1} \{ d_{1,n}[P_{y_n}(\hat{\theta}^U)] = T, d_{2,n}^U[P_{y_n}(\hat{\theta}_S^U)] = A \} \end{aligned}$$

- But for perturbation $\widetilde{\theta_{S,t}^U}$ of $\hat{\theta}_S^U$'s asymptotic distribution, can have:

$$\begin{aligned} \frac{1}{N_A} \sum_{n=1}^N P(y_n = S | x_n, z_n; \widetilde{\theta_{S,t}^U}) \mathbb{1} \{ d_{1,n}[P_{y_n}(\hat{\theta}_U)] = T, d_{2,n}^R[P_{y_n}(\hat{\theta}_S^U)] = A \} \\ < \frac{1}{N_A} \sum_{n=1}^N P(y_n = S | x_n, z_n; \widetilde{\theta_{S,t}^U}) \mathbb{1} \{ d_{1,n}[P_{y_n}(\hat{\theta}_U)] = T, d_{2,n}^U[P_{y_n}(\hat{\theta}_S^U)] = A \} \end{aligned}$$

- For waitlist models, compare matriculants, not acceptances

A2.1: Randomization Tests 2

- **Question:** Are deviation gains robust to estimation error?
- **Test 1:** Across T perturbations, plot CDFs of $\overline{P(\text{Success})}$ of both acceptance sets. Does the model's CDF stochastically dominate the actual decision rule's CDF?
- **Test 2:** Two-sample Kolmogorov-Smirnov test of equality of CDFs:
 - Let $X = \overline{P_y[d(\hat{\theta}^U), \widetilde{\theta}_S^U]}$, and $F_T(x)$ be X 's CDF over T perturbations
 - Then $D_T = \sup_x |F_T^R(x) - F_T^U(x)|$. Reject equality if $D_T > \sqrt{\frac{-\log(\alpha/2)}{T}}$
- **Open Question:** Would deviation gains be borne out in practice?

A2.1: Structural Summary

- **Results:** Estimation results are well behaved
 - **Year-Static:** Likelihood-ratio test rejects and deviation gains statistically significant only for simulated dataset where committee misvalues applicant characteristics
 - **Year-Dynamic:** Likelihood-ratio test always rejects, but gains exist only for non-optimizing dataset. Gains are slightly larger than in year-myopic model
 - **Waitlist-Hybrid/Dynamic:** Matriculation estimates are as expected
- Example of cutoff probability reversal if committee transitions few files in Round 1:
 - Three applicants: A, B, and C. Committee transitions two, accepts one
 - A is best and C is worst overall, but A is worst in objective variables
 - Committee rejects A in Round 1 and accepts B, who is worse than A
 - By assuming h hours to read application file and w hourly wage, and calculating model's $\overline{P(\text{Success})}$ induced by all possible N_T , can put dollar value on success

A2.1: Extensions

- **Extension 1:** Create matriculation score uncorrelated with $P(\text{Success})$
 - For accepted applicants, use matriculation predictors in essays/rec letters
 - Can help committee find “people that we can afford” (*Moneyball*)
- **Extension 2:** Relax assumption that committee maximizes $P(\text{Success})$
 - Instead maximize convex combination of $P(\text{Success})$ and other objectives
 - **Example:** Committee may want diverse cohort (e.g. across fields):
 $\alpha P(\text{Success}) + (1 - \alpha)\text{Diversity}$, where $\alpha \in [0, 1]$ can be estimated
- **Extension 3:** Multiyear models (see Appendix 2.2)
 - Two-round models repeat over infinite horizon with discounting
 - States contain info about past years/rounds, and committee values future years/rounds (memory includes matriculation score and diversity)

A2.2: Multiyear Decision Graph

A2.2: Multiyear Memory (Matriculation)

- Suppose committee maximizes discounted “lifetime” cohort success
- Respecify $P(y_2^* = S|t)$, where $t = \text{year}$, as $L(y_2^* = S|\bar{q}, M, c_{-1})$
 - $\bar{q}$ = current year’s average surviving applicant quality (i.e. average $P(\text{Success})$)
 - M = current year’s number of surviving applicants
 - c_{-1} = previous year’s cohort size
 - $L(\text{Cutoff}_2)$ increases in all three. In particular, in increases in c_{-1} because committee must keep number of total students in program relatively constant
- What information available at start of Round 2 determines c ?
 - **Always:** $\bar{m}$ = average surviving applicant matriculation score
 - **If and only if $d_2 = A$:** m = applicant’s matriculation score

A2.2: Multiyear Dynamics (Matriculation)

Theorem 4 (Proof)

Success probability equal, an applicant's Round 2 acceptance probability is strictly increasing in their matriculation score.

- With memory, optimal dynamic decision may not equal optimal myopic one
 - May accept applicant with high m even if $P(\text{Success}) < L(\text{Cutoff}_2)$
 - High m means high $\bar{F}_{c|m}$, which means high $\mathbb{E}[L(\text{Cutoff}_2)']$ and future EV
 - Accepting applicants who will matriculate helps avoid future TA shortages, and accepting more applicants next year is undesirable if there's any risk aversion
- Harder to estimate since multiyear problem has no closed-form solution
 - Reduced-form results and factor analysis can help reduce dimensionality

A2.2: Multiyear Model (Matriculation), Round 2

$$v_2(x, z, m, \bar{m}, \bar{q}, M, c_{-1}, \epsilon_2) = \max_{d_2 \in \{A, R\}} u_2(x, z, m, \bar{m}, \bar{q}, M, c_{-1}, d_2) + \epsilon_2(d_2), \text{ such that:}$$

$$u_2(x, z, m, \bar{m}, \bar{q}, M, c_{-1}, d_2) = \{P(y = S|x, z) + \beta \mathbb{E}[v_1(x', t', c, \epsilon_1')|m, \bar{m}]\} \mathbb{1}(d_2 = A) \\ + \{L(y_2^* = S|\bar{q}, M, c_{-1}) + \beta \mathbb{E}[v_1(x', t', c, \epsilon_1')|\bar{m}]\} \mathbb{1}(d_2 = R), \text{ such that:}$$

$$\mathbb{E}[v_1(x', t', c, \epsilon_1')|(m), \bar{m}] = \int_c \int_{t'} \int_{x'} \sigma \log \left(\sum_{d_1' \in \{T, R\}} e^{u_1(x', t', c, d_1')/\sigma} \right) dF_x(x') dF_t(t') dF_{c|(m), \bar{m}}(c|(m), \bar{m})$$

Conditional Choice Probabilities:

$$P(d_2|x, z, m, \bar{m}, \bar{q}, M, c_{-1}) = \frac{\exp(u_2(x, z, m, \bar{m}, \bar{q}, M, c_{-1}, d_2)/\sigma)}{\sum_{\tilde{d}_2 \in \{A, R\}} \exp(u_2(x, z, m, \bar{m}, \bar{q}, M, c_{-1}, \tilde{d}_2)/\sigma)}$$

A2.2: Multiyear Model (Matriculation), Round 1

$$v_1(x, t, c_{-1}, \epsilon_1) = \max_{d_1 \in \{T, R\}} u_1(x, t, c_{-1}, d_1) + \epsilon_1(d_1), \text{ such that:}$$

$$u_1(x, t, c_{-1}, d_1) = \mathbb{E}[v_2(x, z, m, \bar{m}, \bar{q}, M, c_{-1}, \epsilon_2) | x, c_{-1}] \mathbb{1}(d_1 = T) \\ + \{L(y_1^* = S | t) + \beta \mathbb{E}[v_1(x', t', c, \epsilon_1') | \bar{m}]\} \mathbb{1}(d_1 = R), \text{ such that:}$$

$$\mathbb{E}[v_2(x, z, m, \bar{m}, \bar{q}, M, c_{-1}, \epsilon_2) | x, c_{-1}] = \\ \int_{\tilde{M}} \int_{\tilde{q}} \int_{\tilde{m}} \int_{\tilde{m}} \int_{\tilde{z}} \sigma \log \left(\sum_{\tilde{d}_2 \in \{A, R\}} e^{u_2(x, \tilde{z}, \tilde{m}, \tilde{m}, \tilde{q}, \tilde{M}, c_{-1}, \tilde{d}_2) / \sigma} \right) dF_{z|x}(\tilde{z}|x) dF_{m|x}(\tilde{m}|x) dF_{\bar{m}}(\tilde{m}) dF_{\bar{q}}(\tilde{q}) dF_M(\tilde{M})$$

Conditional Choice Probabilities:

$$P(d_1 | x, t, c_{-1}) = \frac{\exp(u_1(x, t, c_{-1}, d_1) / \sigma)}{\sum_{\tilde{d}_1 \in \{T, R\}} \exp(u_1(x, t, c_{-1}, \tilde{d}_1) / \sigma)}$$

A2.2: Multiyear (Matriculation) Parameterization 1

Unrestricted CCPs:

$$P_{d_1} = P(d_1 = T | x, t, c_{-1}; \theta_T) = \frac{\exp(f_T(x, t, c_{-1})\theta_T)}{1 + \exp(f_T(x, t, c_{-1})\theta_T)}$$

$$P_{d_2} = P(d_2 = A | x, z, m, \overline{m}, \overline{q}, M, c_{-1}; \theta_A) = \frac{\exp(f_A(x, z, m, \overline{m}, \overline{q}, M, c_{-1})\theta_A)}{1 + \exp(f_A(x, z, m, \overline{m}, \overline{q}, M, c_{-1})\theta_A)}$$

Success Probability:

$$P_y = P(y = S | x, z; \theta_S) = \frac{\exp(f_S(x, z)\theta_S)}{1 + \exp(f_S(x, z)\theta_S)}$$

Cutoff Levels:

$$L_{y_1^*} = L(y_1^* = S | t; \theta_{S_1^*}) = f_{S_1^*}(t)\theta_{S_1^*}$$
$$L_{y_2^*} = L(y_2^* = S | \overline{q}, M, c_{-1}; \theta_{S_2^*}) = f_{S_2^*}(\overline{q}, M, c_{-1})\theta_{S_2^*}$$

A2.2: Multiyear (Matriculation) Parameterization 2.1

★ Assume (x, t) mutually independent, and next year independent of current year:

$$\begin{aligned} \mathbb{E}[v_1(x', t', c, \epsilon_1') | (m), \bar{m}] &= \int_c \int_{t'} \int_{x'} \sigma \log \left(\sum_{d_1' \in \{T, R\}} e^{u_1(x', t', c, d_1') / \sigma} \right) dF_x(x') dF_t(t') dF_{c|(m), \bar{m}}(c | (m), \bar{m}) \\ &= \int_c \int_{t_1'} \cdots \int_{t_{J_t}'} \int_{x_1'} \cdots \int_{x_{J_x}'} \left[\cdot \right] dF_{x,1}(x_1' | x_2', \dots, x_{J_x}') \cdots dF_{x,J_x}(x_{J_x}') dF_{t,1}(t_1' | t_2', \dots, t_{J_t}') \cdots dF_{t,J_t}(t_{J_t}') dF_{c|(m), \bar{m}}(c | (m), \bar{m}) \end{aligned}$$

- **Continuous:** $f_x(x_j; \beta_{F_{x,j}}, \sigma_{F_{x,j}}^2) = \frac{1}{\sqrt{2\pi\sigma_{F_{x,j}}^2}} \exp \left[\frac{-1}{2\sigma_{F_{x,j}}^2} (x_j - \beta_{F_{x,j}})^2 \right]$

- **Binary:** $P(x_j = 1; \theta_{F_{x,j}}) = \frac{\exp(\theta_{F_{x,j}})}{1 + \exp(\theta_{F_{x,j}})}$

- **Multinomial:** $P(x_j = (k \neq K); \theta_{F_{x,j}}^k) = \frac{\exp(\theta_{F_{x,j}}^k)}{1 + \sum_{\ell=1}^{K-1} \exp(\theta_{F_{x,j}}^\ell)}$

A2.2: Multiyear (Matriculation) Parameterization 2.2

★ Assume $(z, m, \bar{m}, \bar{q}, M)$ mutually independent such that $(z, m)|x$:

$$\begin{aligned} \mathbb{E}[v_2(x, z, m, \bar{m}, \bar{q}, M, c_{-1}, \epsilon_2)|x, c_{-1}] &= \\ \int_{\tilde{M}} \int_{\tilde{\bar{q}}} \int_{\tilde{\bar{m}}} \int_{\tilde{m}} \int_{\tilde{z}} \sigma \log \left(\sum_{\tilde{d}_2 \in \{A, R\}} e^{u_2(x, \tilde{z}, \tilde{m}, \tilde{\bar{m}}, \tilde{\bar{q}}, \tilde{M}, c_{-1}, \tilde{d}_2)/\sigma} \right) dF_{z|x}(\tilde{z}|x) dF_{m|x}(\tilde{m}|x) dF_{\bar{m}}(\tilde{\bar{m}}) dF_{\bar{q}}(\tilde{\bar{q}}) dF_M(\tilde{M}) \\ &= \int_{\tilde{M}} \int_{\tilde{\bar{q}}} \int_{\tilde{\bar{m}}} \int_{\tilde{m}} \int_{\tilde{z}_1} \cdots \int_{\tilde{z}_Z} \left[\cdot \right] dF_{z|x,1}(\tilde{z}_1|\tilde{z}_2, \dots, \tilde{z}_Z, x) \cdots dF_{z|x,Z}(\tilde{z}_Z|x) dF_{m|x}(\tilde{m}|x) dF_{\bar{m}}(\tilde{\bar{m}}) dF_{\bar{q}}(\tilde{\bar{q}}) dF_M(\tilde{M}) \end{aligned}$$

- **Continuous:** $f_{z|x}(z_j|x; \beta_{F_{z|x,j}}, \sigma_{F_{z|x,j}}^2) = \frac{1}{\sqrt{2\pi\sigma_{F_{z|x,j}}^2}} \exp \left[\frac{-1}{2\sigma_{F_{z|x,j}}^2} (z_j - g(x)\beta_{F_{z|x,j}})^2 \right]$
- **Binary:** $P(z_j = 1|x; \theta_{F_{z|x,j}}) = \frac{\exp(g(x)\theta_{F_{z|x,j}})}{1 + \exp(g(x)\theta_{F_{z|x,j}})}$
- **Multinomial:** $P(z_j = (k \neq K)|x; \theta_{F_{z|x,j}^k}) = \frac{\exp(g(x)\theta_{F_{z|x,j}^k})}{1 + \sum_{\ell=1}^{K-1} \exp(g(x)\theta_{F_{z|x,j}^\ell})}$

A2.2: Multiyear (Matriculation) Likelihood

$$\mathcal{L}_N^U(\theta) = \prod_{n=1}^{N_T} f_x(x_n; \theta_{F_x}) f_t(t_n; \theta_{F_t}) f_{z|x}(z_n|x_n; \theta_{F_{z|x}}) f_{m|x}(m_n|x_n; \theta_{F_{m|x}}) f_{\bar{m}}(\bar{m}_n; \theta_{F_{\bar{m}}}) f_{\bar{q}}(\bar{q}_n; \theta_{F_{\bar{q}}}) f_M(M_n; \theta_{F_M})$$

$$f_{c|m, \bar{m}}(c_n|m_n, \bar{m}_n; \theta_{F_{c|m, \bar{m}}}) P_{d_{1,n}}(\theta_T) P_{d_{2,n}}(\theta_A)^{\mathbb{1}(d_{2,n}=A)} (1 - P_{d_{2,n}}(\theta_A))^{\mathbb{1}(d_{2,n}=R)} P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)} (1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)}$$

$$\prod_{n=N_T+1}^N f_x(x_n; \theta_{F_x}) f_t(t_n; \theta_{F_t}) f_{z|x}(z_n|x_n; \theta_{F_{z|x}}) f_{m|x}(m_n|x_n; \theta_{F_{m|x}}) (1 - P_{d_{1,n}}(\theta_T))$$

- For $\mathcal{L}^R$ and $\mathcal{L}^U$, estimate θ_S^U with 1st-stage likelihood to get $\bar{q}$ = current year's $\overline{P_{y_n}}$:
 $\mathcal{L}_{N_T}^P(\theta_S) = \prod_{n=1}^{N_T} P_{y_n}(\theta_S)^{\mathbb{1}(y_n=S)} (1 - P_{y_n}(\theta_S))^{\mathbb{1}(y_n=F)}$
- As with year-dynamic model, for $\mathcal{L}_R$, use (θ_F^U, θ_S^U) as initial guess of (θ_F^R, θ_S^R)

A2.2: Multiyear Memory and Dynamics (Diversity)

- Let additional state a = any diversity variable affecting success
 - For example, $a = \mathbb{1}(\text{TheoryField})$; theory is less common than applied
 - Let $\bar{a}_{-1}$ = percentage of last year's acceptance set that's theory
 - If $|a - \bar{a}_{-1}|$ is small, $P(\text{Success})$ may decrease because future advisor may be too busy (effect may be unidentifiable if program never gets too imbalanced)

Theorem 5 (Proof)

Consider any two applicants, one with $a = 1$ and one with $a = 0$, but with equal success probabilities and therefore different values of x or z . Suppose $P(a' = 1) = p > 0$. Then for all sufficiently small p , the $a = 1$ applicant has a strictly greater Round 2 acceptance probability.

- Optimal dynamic decision may not equal optimal myopic one. May accept diverse applicant with $P(\text{Success}) < L(\text{Cutoff})$ to increase $P(\text{Success})$ of next year's pool
 - Relative to $a = 0$, $a = 1 \Rightarrow$ higher $\bar{F}_{\bar{a}|a} \Rightarrow$ higher $\mathbb{E}[P(\text{Success})']$ and future EV

A2.2: Multiyear Model (Diversity), Round 2

$$v_2(x, z, a, \bar{a}_{-1}, t, \epsilon_2) = \max_{d_2 \in \{A, R\}} u_2(x, z, a, \bar{a}_{-1}, t, d_2) + \epsilon_2(d_2), \text{ such that:}$$

$$u_2(x, z, a, \bar{a}_{-1}, t, d_2) = \{P(y = S|x, z, |a - \bar{a}_{-1}|) + \beta \mathbb{E}[v_1(x', \bar{a}, t', \epsilon'_1)|a]\} \mathbb{1}(d_2 = A) \\ + \{L(y_2^* = S|t) + \beta \mathbb{E}[v_1(x', \bar{a}, t', \epsilon'_1)]\} \mathbb{1}(d_2 = R), \text{ such that:}$$

$$\mathbb{E}[v_1(x', \bar{a}, t', \epsilon'_1)|a] = \int_{\tilde{t}'} \int_{\tilde{\bar{a}}} \int_{\tilde{x}'} \sigma \log \left(\sum_{d'_1 \in \{T, R\}} e^{u_1(\tilde{x}', \tilde{\bar{a}}, \tilde{t}', d'_1)/\sigma} \right) dF_{x'}(\tilde{x}') dF_{\bar{a}|a}(\tilde{\bar{a}}|a) dF_{t'}(\tilde{t}')$$

Conditional Choice Probabilities:

$$P(d_2|x, z, a, \bar{a}_{-1}, t) = \frac{\exp(u_2(x, z, a, \bar{a}_{-1}, t, d_2)/\sigma)}{\sum_{\tilde{d}_2 \in \{A, R\}} \exp(u_2(x, z, a, \bar{a}_{-1}, t, \tilde{d}_2)/\sigma)}$$

A2.2: Multiyear Model (Diversity), Round 1

$$v_1(x, \bar{a}_{-1}, t, \epsilon_1) = \max_{d_1 \in \{T, R\}} u_1(x, \bar{a}_{-1}, t, d_1) + \epsilon_1(d_1), \text{ such that:}$$

$$u_1(x, \bar{a}_{-1}, t, d_1) = \mathbb{E}[v_2(x, z, a, \bar{a}_{-1}, t, \epsilon_2) | x, \bar{a}_{-1}, t] \mathbb{1}(d_1 = T) \\ + \{L(y_1^* = S | t) + \beta \mathbb{E}[v_1(x', \bar{a}, t', \epsilon'_1)]\} \mathbb{1}(d_1 = R), \text{ such that:}$$

$$\mathbb{E}[v_2(x, z, a, \bar{a}_{-1}, t, \epsilon_2) | x, \bar{a}_{-1}, t] = \int_{\tilde{a}} \int_{\tilde{z}} \sigma \log \left(\sum_{\tilde{d}_2 \in A, R} e^{u_2(x, \tilde{z}, \tilde{a}, \bar{a}_{-1}, t, \tilde{d}_2) / \sigma} \right) dF_{z|x}(\tilde{z}|x) dF_a(\tilde{a})$$

$$\mathbb{E}[v_1(x', \bar{a}, t', \epsilon'_1)] = \int_{\tilde{t}'} \int_{\tilde{a}} \int_{\tilde{x}'} \sigma \log \left(\sum_{d'_1 \in \{T, R\}} e^{u_1(\tilde{x}', \tilde{a}, \tilde{t}', d'_1) / \sigma} \right) dF_{x'}(\tilde{x}') dF_{\bar{a}}(\tilde{a}) dF_{t'}(\tilde{t}')$$

Conditional Choice Probabilities:

$$P(d_1 | x, \bar{a}_{-1}, t) = \frac{\exp(u_1(x, \bar{a}_{-1}, t, d_1) / \sigma)}{\sum_{\tilde{d}_1 \in \{T, R\}} \exp(u_1(x, \bar{a}_{-1}, t, \tilde{d}_1) / \sigma)}$$

A2.2: Multiyears (Diversity) Parameterization 1

Unrestricted CCPs:

$$P_{d_1} = P(d_1 = T | x, \bar{a}_{-1}, t; \theta_T) = \frac{\exp(f_T(x, \bar{a}_{-1}, t)\theta_T)}{1 + \exp(f_T(x, \bar{a}_{-1}, t)\theta_T)}$$

$$P_{d_2} = P(d_2 = A | x, z, a, \bar{a}_{-1}, t; \theta_A) = \frac{\exp(f_A(x, z, a, \bar{a}_{-1}, t)\theta_A)}{1 + \exp(f_A(x, z, a, \bar{a}_{-1}, t)\theta_A)}$$

Success Probability:

$$P_y = P(y = S | x, z, |a - \bar{a}_{-1}|; \theta_S) = \frac{\exp(f_S(x, z, |a - \bar{a}_{-1}|)\theta_S)}{1 + \exp(f_S(x, z, |a - \bar{a}_{-1}|)\theta_S)}$$

Cutoff Levels:

$$L_{y_1^*} = L(y_1^* = S | t; \theta_{S_1^*}) = f_{S_1^*}(t)\theta_{S_1^*}$$

$$L_{y_2^*} = L(y_2^* = S | t; \theta_{S_2^*}) = f_{S_2^*}(t)\theta_{S_2^*}$$

A2.2: Multiyear (Diversity) Parameterization 2.1

★ Assume $(x, \bar{a}, t)$ mutually independent such that $\bar{a}|a$, and t' independent of t :

$$\mathbb{E}[v_1(x', \bar{a}, t', \epsilon'_1)|a] = \int_{\tilde{t}'} \int_{\tilde{\bar{a}}} \int_{\tilde{x}'} \sigma \log \left(\sum_{d'_1 \in \{T, R\}} e^{u_1(\tilde{x}', \tilde{\bar{a}}, \tilde{t}', d'_1)/\sigma} \right) dF_{x'}(\tilde{x}') dF_{\bar{a}|a}(\tilde{\bar{a}}|a) dF_{t'}(\tilde{t}') =$$

$$\int_{\tilde{t}'_1} \cdots \int_{\tilde{t}'_{J_t}} \int_{\tilde{\bar{a}}} \int_{\tilde{x}'_1} \cdots \int_{\tilde{x}'_{J_x}} \left[\cdot \right] F_{x,1}(x'_1|x'_2, \dots, x'_{J_x}) \cdots dF_{x,J_x}(x'_{J_x}) dF_{\bar{a}|a}(\tilde{\bar{a}}|a) dF_{t,1}(t'_1|t'_2, \dots, t'_{J_t}) \cdots dF_{t,J_t}(t'_{J_t})$$

- **Continuous:** $f_x(x_j; \beta_{F_{x,j}}, \sigma_{F_{x,j}}^2) = \frac{1}{\sqrt{2\pi\sigma_{F_{x,j}}^2}} \exp \left[\frac{-1}{2\sigma_{F_{x,j}}^2} (x_j - \beta_{F_{x,j}})^2 \right]$

- **Binary:** $P(x_j = 1; \theta_{F_{x,j}}) = \frac{\exp(\theta_{F_{x,j}})}{1 + \exp(\theta_{F_{x,j}})}$

- **Multinomial:** $P(x_j = (k \neq K); \theta_{F_{x,j}}^k) = \frac{\exp(\theta_{F_{x,j}}^k)}{1 + \sum_{\ell=1}^{K-1} \exp(\theta_{F_{x,j}}^\ell)}$

A2.2: Multiyear (Diversity) Parameterization 2.2

★ Assume (z, a) independent, such that $z|x$:

$$\begin{aligned}\mathbb{E}[v_2(x, z, a, \bar{a}_{-1}, t, \epsilon_2)|x, \bar{a}_{-1}, t] &= \int_{\tilde{a}} \int_{\tilde{z}} \sigma \log \left(\sum_{\tilde{d}_2 \in A, R} e^{u_2(x, \tilde{z}, \tilde{a}, \bar{a}_{-1}, t, \tilde{d}_2)/\sigma} \right) dF_{z|x}(\tilde{z}|x) dF_a(\tilde{a}) \\ &= \int_{\tilde{a}} \int_{\tilde{z}_1} \cdots \int_{\tilde{z}_J} \left[\cdot \right] dF_1(\tilde{z}_1|\tilde{z}_2, \dots, \tilde{z}_J, x) \cdots dF_J(\tilde{z}_J|x) dF_a(\tilde{a})\end{aligned}$$

- **Continuous:** $f_{z|x}(z_j|x; \beta_{F_{z|x,j}}, \sigma_{F_{z|x,j}}^2) = \frac{1}{\sqrt{2\pi\sigma_{F_{z|x,j}}^2}} \exp \left[\frac{-1}{2\sigma_{F_{z|x,j}}^2} (z_j - g(x)\beta_{F_{z|x,j}})^2 \right]$
- **Binary:** $P(z_j = 1|x; \theta_{F_{z|x,j}}) = \frac{\exp(g(x)\theta_{F_{z|x,j}})}{1 + \exp(g(x)\theta_{F_{z|x,j}})}$
- **Multinomial:** $P(z_j = (k \neq K)|x; \theta_{F_{z|x,j}}^k) = \frac{\exp(g(x)\theta_{F_{z|x,j}}^k)}{1 + \sum_{\ell=1}^{K-1} \exp(g(x)\theta_{F_{z|x,j}}^\ell)}$

A2.2: Multiyear (Diversity) Likelihood

$$\mathcal{L}_N^U(\theta) = \prod_{n=1}^{N_A} f_x(x_n; \theta_{F_x}) f_t(t_n; \theta_{F_t}) f_{z|x}(z_n|x_n; \theta_{F_{z|x}}) f_a(a) f_{\bar{a}}(\bar{a}) f_{\bar{a}|a}(\bar{a}|a) P_{d_{2,n}} P_{y_n}^{\mathbb{1}(y_n=S)} (1 - P_{y_n})^{\mathbb{1}(y_n=F)}$$

$$\prod_{n=N_A+1}^{N_{T,R}} f_x(x_n; \theta_{F_x}) f_t(t_n; \theta_{F_t}) f_{z|x}(z_n|x_n; \theta_{F_{z|x}}) f_a(a) f_{\bar{a}}(\bar{a}) (1 - P_{d_{2,n}}) P_{y_n}^{\mathbb{1}(y_n=S)} (1 - P_{y_n})^{\mathbb{1}(y_n=F)}$$

$$\prod_{n=N_{T,R}+1}^N f_x(x_n; \theta_{F_x}) f_t(t_n; \theta_{F_t}) f_{z|x}(z_n|x_n; \theta_{F_{z|x}}) f_a(a) f_{\bar{a}}(\bar{a}) (1 - P_{d_{1,n}})$$

- Estimate $f_{\bar{a}|a}(\bar{a}|a)$ on N_A accepted applicants only
- As with year-dynamic model, for $\mathcal{L}_R$, use (θ_F^U, θ_S^U) as initial guess of (θ_F^R, θ_S^R)
